1.1 INTRODUCTION

1.2 Purpose and Scope

This Closure and Reclamation Plan for the Liard East field includes A-01, F-36, I-02, I-46, N-01 and O-35. A map of the Liard South field is provided in Appendix A.

1.3 Closure and Reclamation Planning Team

The current reclamation and closure team consists of the following Paramount personnel:

Table 1 Closure Planning Team

Role	Name	Contact
Director, Asset Management	John Hawkins	Telephone: 403-817-5074 Email: john.hawkins@Paramountres.com
Environmental Coordinator	Ian Keir	Telephone: 403-817-5077 Email: ian.keir@Paramountres.com
Regulatory and Community Affairs Advisor	Terence Hughes	Telephone: 403-206-3859 Email: terence.hughes@Paramountres.com

2.0 CLOSURE AND RECLAMATION PROGRAM SUMMARY

This Closure and Reclamation Plan intends to describe the reclamation strategy and provide updated timelines and a description of activities for the Site. The following information provides an overview of the closure and reclamation process and a summary of activities at the Site to date.

2.1 Phase 1 Environmental Site Assessment

The primary objective of a Phase 1 Environmental Site Assessment (P1 ESA) is to determine whether a site is or may be contaminated and to identify areas of potential environmental concern (APECS) and contaminants of potential concern (COPCS).

P1 ESAs have been completed for all sites and are attached in Appendix B.

2.2 Abandonment and Surface Equipment Removal

The remaining wells at F-36 and I-02 will be abandoned accordance with the Office of the Regulator of Oil and Gas Operations (“OROGO”) Well Suspension and Abandonment Guidelines and Interpretation Notes. Any remaining surface infrastructure will be removed following abandonment.

2.1 Phase 2 Environmental Site Assessment

The purpose of a Phase 2 Environmental Site Assessment (P2 ESA) is to determine, through intrusive sampling, the presence or absence of COPCS and determine the extent of any APECs. P2 ESAs have been completed at all locations except I-02 which will be assessed in October 2021. A supplemental P2 ESA is planned for F-36 at the same time. Existing P2 ESAs are attached in Appendix B.

2.2 Development of Site-Specific Remediation Guidelines

Site-specific remediation guidelines (SSRGs) are concentrations of chemical parameters in water and soil that are used as targets during remedial activities. They are developed using more detailed Site information than generic guidelines that may have been previously applied.

SynergyAspen Environmental (SynergyAspen) has reviewed the existing assessment information for all sites, except I-02 and has developed SSRGs for all sites. These reports are attached in Appendix C.

2.3 Remediation

Remediation can include off-site disposal, on-site treatment, as well as passive treatments including monitoring natural attenuation.

No remediation is currently proposed and this C&R will be updated if new information from the October 2021 site assessments indicates remediation will be required prior to reclamation earthworks.

2.6 Reclamation

While reclamation can refer to the entire process described above, in this instance it refers to reclamation earthworks, revegetation and the evaluation of the successful re-establishment of disturbed areas to equivalent land capability. Reclamation earthworks involves re-establishing topography and drainage so that it is similar to off-site conditions and re-establishing soil profiles, where necessary, to provide suitable medium for revegetation. Revegetation is considered successful when areas disturbed by the gas field development and remediation have vegetation communities established that are self-sustaining and on the trajectory towards equivalent land capability to the surrounding areas. This will be determined when the vegetative cover and species assemblage is similar to equivalent community types in the surrounding areas (i.e. percent cover of vegetation, woody species establishment, species diversity). Prevalence of invasive species should be no greater than the surrounding areas.

3.0 ENGAGEMENT

The level of engagement with stakeholders by Paramount, has been and will continue to be, reflective of its activity level in the area. Prior to and during construction and development activities engagement activities were more frequent and intense and included studies, community meetings, open houses, meetings with community leaders and Councils, telephone calls and both written and electronically notifications.

5.0 PERMANENT CLOSURE, MONITORING and RECLAMATION

Permanent closure is the final closure of a site with no foreseeable intent by the existing proponent to return to either active exploration or development. Permanent closure indicates that the proponent intends to have no activity on the site aside from post-closure monitoring and potential contingency actions. Permanent closure does not, however, preclude the proponent or another party from pursuing opportunities at the existing site or in the area at a time beyond the foreseeable future.

Paramount will be seeking permanent closure of the Field. Paramount does not anticipate any negative residual effects to remain after reclamation is complete. Post reclamation activities will consist of reconnaissance level vegetation and terrain monitoring to confirm reclamation success. Monitoring is anticipated to occur annually, during summer months for a period of 3 to 5 five years. The first year will also include confirmatory soil sampling to verify previous reclamation results.

Vegetation monitoring will include documentation of revegetation and checking the site for invasive species. Terrain monitoring will include identification of erosion and settling issues. If the presence of standing water is observed it will be monitored and sampled as necessary. If during the annual monitoring or from sampling issues are identified that need to be addressed minor reclamation treatments will be conducted via helicopter. These could include invasive species management, scarification, recontouring, erosion control measure seeding and other vegetation management techniques.

6.0 TEMPORARY CLOSURE

Paramount has no intention of resuming activities on sites slated for closure. Therefore, temporary closure is not applicable to this Closure and Reclamation Plan.

7.0 FINANCIAL SECURITY

An updated Security Estimate will be provided under a separate cover letter based on the work remaining at the Site prior to the end of 2020.

8.0 TIMELINE AND PRIORITY

The Closure and Reclamation program will be implemented over multiple years and will be subject to changes as new information becomes available. Table 2 below presents the proposed sequence of events.

Table 2 Proposed Sequence of Events

Action	Rationale	General Timeframe
• Site Assessments at I-02 and F-36	• I-02 has not yet been assessed.	October 2021
• Conduct Well Abandonment and Reclamation Earthworks where required	• Complete well abandonment and reclamation earthworks as required to meet end land use goals.	2021-2023
• Annual Site Visits	• To ensure that revegetation is on an appropriate trajectory and to monitor for undesirable species presence.	2022-2025
• Site closure	• Conduct a site visit with the inspector with the intention of receiving final regulatory closure on the site.	2026

Phase 1 Environmental Site Assessment
March 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

INTRODUCTION

Paramount Resources Ltd. (Paramount) retained North Shore Environmental Consultants Inc. (North Shore) to conduct a Phase 1 Environmental Site Assessment (ESA) for the Paramount et al Liard A-01 drilled and abandoned well located in the Northwest Territories (NWT) at Unit A, Section 01 Grid Area 60° 10', 123° 15' (Site).

The purpose of the Phase 1 ESA was to assess and qualify potential environmental concerns associated with the Site through a historic records review and site visit. The Phase 1 ESA was conducted in general accordance with the Canadian Standards Association (CSA) *Standard Z678-01: Phase I Environmental Site Assessment* (CSA, 2001). The Alberta Energy Regulator (AER) *Assessing Drilling Waste Disposal Areas: Compliance Option for Reclamation Certification* (AER, 2014) guidelines were used to assess the drilling waste associated with the Site.

FINDINGS

The Paramount et al Liard A-01 well was drilled between February 9, 1999 and March 19, 1999 to a depth of 2,046 m. The rig was released on March 25, 1999. The well was never put on production. The site is accessible by helicopter and winter roads which enter the lease from the west.

Infrastructure identified in association with the site includes only the wellhead. According to the Paramount June 2009 As-built sketch and survey plan, a 40 m x 60 m temporary campsite was located west of the wellsite on the north side of the road. There were no log decks, borrow pits or remote sumps identified in association with the wellsite.

A review of aerial photograph imagery from 2011 and 2014 did not identify any areas of potential concern on the wellsite. The wellsite appears well vegetated in the 2014 image.

Drilling Waste Disposal

According to the September 20, 2000 Environmental Inspection Report, sumps on the wellsite had slumped. It is assumed that the drilling waste was disposed of on site by mix-bury-cover.

The surface hole was drilled using a gel-chem drilling mud system and the main hole was drilled with calcium chloride invert. There was no drilling waste disposal documentation available for review and as a result North Shore completed a Compliance Option 2 checklist and associated calculations as per the *Assessing Drilling Waste Disposal Areas: Compliance Options for Reclamation Certification* document (AER, 2014). The drilling waste exceeds salt and post-disposal oil concentration calculation criteria and an invert drilling mud was used without documentation of proper disposal. Further assessment of the drilling waste disposal area is required.

Spills & Complaints

A review of the NWT Resource Wildlife and Economic Development's Hazardous Material Spill Database was conducted. There were no spills identified in association with the wellsite.

Previous Assessments/Reports

An Environmental Impact Assessment (EIA) was completed by Golder Associates in December 1998 prior to the construction of the wellsite. The EIA documented pre-construction site conditions including vegetation, indication of wildlife and stream crossings on the proposed access road.

Interviews

There were no Paramount operations personnel with historic knowledge of drilling or construction activities associated with the wellsite.

Site Visit

A site visit was conducted at the wellsite on February 10, 2017. The topography of the area including the wellsite is gently rolling with drainage towards the north/northeast. Vegetation on and off site consisted of mosses, alder, willow, spruce and aspen. There was reduced woody vegetation cover on the southeast corner of the wellsite. The site was constructed using cut and fill construction methods; soil cut from the southern portion of the wellsite was used to fill the north-northeast portions of the lease. The wellhead was the only infrastructure identified on site at the time of the assessment. A minor amount of staining was noted on the snow near the wellhead.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information gathered for this Phase 1 ESA from the historic records review and the site inspection, North Shore concludes that there is a potential for environmental impact in connection with the site. A Phase 2 ESA is recommended to assess the following areas of potential concern:

- On site drilling waste disposal area; and
- Well centre.

DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

In the preparation of this report, selected Alberta Energy Regulator (AER) reference material has been gathered from AbaData™ (property of Abacus Datagraphics Ltd.), which is an online information source. The information provided by AbaData is received directly from the AER, electronically updated on a monthly basis and is assumed to be correct.

CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : W.V. JOHNSON, CLS
OCTOBER, 1998.

LEGEND

UTM coordinates are computed for Zone 10, central meridian 123° W. Bearings were derived from differentially corrected GPS observations and are referred to meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995213.

Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Petitot' Elev. = 218.241m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

THIS SURVEY WAS EXECUTED DURING THE PERIOD OCTOBER 13th TO OCTOBER 14th, 1998. BY W.V. JOHNSON, CLS

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Sworn before me at Fort St. John, this 18th day of October, 1998.

Drilling Waste Documentation

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information:

Unique Identifier (UI)	Paramount et al Liard A-01
Spud Date	February 9, 1999
Well Depth	2046

1.1 Disposal Method (if known)*: Assumed mix-bury-cover

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: The sump was located on site

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.

For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☐	☒
If yes, were the disposal areas separate from one another?	☐ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☐ ☐ ☐ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☒ ☐ ☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☒ ☐	☐ ☐ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☒	☐ Phase 2 required ☐ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☐	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used?	☒	☐
If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒ Phase 2 required

	Yes	No
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☐	☐ ☒ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required

	Yes	No
3.3 Was zinc carbonate added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ ☐ Show calculation on attached form	☒ ☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*? If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available? If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐ ☐ ☐	☒ ☐ Phase 2 required ☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling? If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐ ☐	☐ ☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☐ Show calculation on attached form	☒ Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Surface Hole Drilling Mud Additive List

Product Name	Amount Used	Brief Description of Product
Soda Ash	1 sack	Calcium Remover
Gel	224 sacks	Viscosifier
Defoamer	2 pails	Surface Active Agent
Desco	5 sacks	Chrome-based Thinner/Dispersant
Sawdust	10 sacks	Lost Circulation Material
Mil-clean	1 sack	Surface Active Agent
Lignite	6 sacks	Thinner/Dispersant
Drispac	1 sack	Viscosifier

Main Hole Drilling Mud Additive List

Product Name	Amount Used	Brief Description of Product
Bicarbonate of Soda	1 sack @ 22.7 kg	Alkalinity pH Control
Defoamer	2 pails @ 20 L	Surface Active Agent
Calcium Carbonate	425 kg @ 25 kg	Weighting Material
Calcium Chloride	53 sacks	Shale Control Inhibitor/ Weighting Material
Carbomul SEA	8 units @ 55 G	Emulsifier
Carbotec	4 units @ 55 G	Oil Mud Emulsifier
Carbo TEQ-E Invert	32 m^3	Hydrocarbon Lubricant
Caustic Soda	2 sacks @ 22.7 kg	Alkalinity pH Control
Chrome-free Desco	6 sacks @ 11.4 kg	Chrome-free Thinner/Dispersant
Diesel Fuel	37 m^3	Hydrocarbon Lubricant
Drispac Plus Regular	1 sack @ 22.7 kg	Viscosifier
Floor Dry	13 sacks @ 15 kg	Oil Absorbent
Ligco	6 sacks @ 22.7 kg	Thinner/Dispersant
Lime	68 sacks @ 22.7 kg	Alkalinity pH Control
Mil-bar	46 sacks @ 40 kg	Weighting Material (Barite)
Mil-clean	2 units @ 55 G	Surface Active Agent
Mil-gel	196 sacks @ 40 kg	Viscosifier
Milmica	2 sacks @ 25 kg	Lost Circulation Material
Milplug	1 sack	Lost Circulation Material
OilGel 3000	44 sacks @ 23 kg	Viscosifier
Sawdust	87 sacks @ 18.1 kg	Lost Circulation Material
Soda Ash	3 sacks @ 40 kg	Calcium Remover
Soluflake Fine	74 sacks @ 23 kg	Lost Circulation Material
Soluflake Medium	2 sacks @ 23 kg	Lost Circulation Material
X Foam	3 pails @ 20 L	Surface Active Agent

Reference Documents (List all source documents used in the completion of this checklist. Attach additional pages if necessary. Documents must be supplied to the AER if requested.)

Baker Hughes Inteq Products Used List
Daily Drilling Reports
Paramount Well File Information
PSAC Historic Drilling Fluid Products
September 2000 Environmental Inspection Report

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

According to the September 20, 2000 Environmental Inspection Report, sumps on the wellsite had slumped. It is assumed that the drilling waste was disposed of by mix-bury-cover.

The surface hole was drilled using a gel-chem drilling mud system and the main hole was drilled with calcium chloride invert. There was no drilling was disposal documentation available for review and as a result a Compliance Option 2 checklist was completed.

The drilling waste exceeds salt and post-disposal oil concentration calculation criteria and a hydrocarbon drilling mud additive was used without documentation of proper disposal. Further assessment of the drilling waste disposal area is required.

Location: Paramount et al Liard A-01 **Spud:** 9-Feb-99

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50* , *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
46	÷	2046	÷	3	=	0.0074943	Meets

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Location: Paramount et al Liard A-01 **Spud:** 9-Feb-99

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
5	÷	2046	÷	3	=	0.000814598	Meets

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Location: Paramount et al Liard A-01 **Spud:** 9-Feb-99

Salt Calculations for Option 2:

Alternative 2

If the volume of drilling waste is not known, use the following calculator to determine the NaOH Equivalent Sacks per metre of well depth. This value must be less than **0.0260** for wells drilled before October 22 1996, or **0.0350** for wells drilled on or after this date. If the value exceeds the target, a Phase 2 ESA (Compliance Option 3) must be conducted.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda	1.816	X	1.00	=	1.816
Soda Ash	5.8	X	0.75	=	4.35
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate	0.908	X	0.95	=	0.8626
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)		X	0.22	=	0
Calcium Chloride	53	X	0.72	=	38.16
Calcium Nitrate		X	0.34	=	0
Envirofloc		X	0.41	=	0
Gypsum**		X	0.59	=	0
Lime**	40.92	X	1.08	=	44.1936
** Max = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns	71.81371557	X	0.68	=	48.83332658

Total NaOH Equivalent Sacks	=	138.2155266	
Well Depth (m)	÷	2046	**Result**
NaOH Equivalent Sacks per Metre	=	**0.0676**	**Exceeds**

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

= Required Field

Alberta Energy Regulator

Drill Stem Test Returns for Option 2

Location: Paramount et al Liard A-01 **Spud:** 9-Feb-99

Hydrocarbons

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return in metres, the percent oil content of the DST fluid, the well depth in metres and the mix ratio. The spreadsheet will calculate the post disposal oil concentration If this value is greater than **0.10%** (dry weight) in subsoil or **0.50%** (dry weight) in topsoil, a Phase 2 ESA (Compliance Option 3) is required.

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)		Oil Content (%)*		Vol. of Oil (m^3 x 100)
97.2	15	0.111248316	x	100.00%	=	11.1248316
97.2	200	1.48331088	x	100.00%	=	148.331088
97.2	10	0.074165544	x	100.00%	=	7.4165544
97.2	45	0.333744948	x	100.00%	=	33.3744948
97.2	290	2.150800776	x	100.00%	=	215.080078
97.2	62	0.459826373	x	100.00%	=	45.9826373
97.2	100	0.74165544	x	100.00%	=	74.165544
97.2	50	0.37082772	x	100.00%	=	37.082772
				Total Volume of Oil	=	572.558
					÷	0.6
				Well Depth (m)	÷	2046
				Mix Ratio**	÷	3
				Post-Disposal Oil Concentration (%)	=	0.1554681

Result
Exceeds

* Actual measured oil concentration must be used if available. If only visual descriptions are available then use the following to estimate oil concentration:

Flecked = 5%

Emulsion = 25%

Oil or oil-cut mud= 100%

Do not include gas-cut mud or mud with no indication of oil.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Drill Stem Test Return Calculations for Compliance Option Two

Location: Paramount et al Liard A-01 **Spud:** 9-Feb-99

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
97.2	660	4.894925904	x	22000	÷	7600	=	14.1695224
97.2	15	0.111248316	x	250000	÷	7600	=	3.65948408
97.2	200	1.48331088	x	34000	÷	7600	=	6.63586446
97.2	10	0.074165544	x	250000	÷	7600	=	2.43965605
97.2	45	0.333744948	x	250000	÷	7600	=	10.9784522
97.2	290	2.150800776	x	50000	÷	7600	=	14.1500051
97.2	62	0.459826373	x	250000	÷	7600	=	15.1258675
97.2	265	1.965386916	x	18000	÷	7600	=	4.65486375
						Total number of sacks	=	71.8137156

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

Phase 2 Environmental Site Assessment
May 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) for the Para et al Fort Liard A-01 wellsite located in the Northwest Territories (NWT) at Unit A, Section 01 Grid Area 60°10', 123°15' (Site). The site is located near Fort Liard, Northwest Territories. The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017. Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines. The areas of potential environmental concern included the following:

- Well centre
- Drilling waste disposal area

On February 10, 2017, 26 boreholes were advanced at the Site. Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

1 INTRODUCTION

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the Para et al Fort Liard A-01 wellsite (Site) located near Fort Liard, Northwest Territories.

1.1 Objective

The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017.

1.2 Scope of Work

The scope of work for the Phase 2 ESA included the following:

- Review background information to assist with establishing site specific protocols.
- Prepare for ground disturbance activities. The defined work area included the lease and a 30 meter (m) buffer zone around the lease boundary.
- Supervise two sets of private utility locating surrounding the proposed ground disturbance locations.
- Conduct a tailgate safety meeting prior to initiating work each day at the Site. This includes North Shore personnel and contractors.
- Characterize and delineate any suspected impacted areas and advance two control boreholes near the site boundary location in a landscape representative of onsite topography.
- Log soil stratigraphy according to the Canadian System of Soil Classification (CSSC) (Soil Classification Working Group, 1998) with additional comments on potential impacts. Collect samples from each borehole and record organic vapor readings.
- Collect borehole soil samples as required based on field screening results.
- Collect field duplicates for every ten samples submitted for analysis.
- Submit selected soil samples for laboratory analysis to determine concentrations of suspected contaminants and background concentrations for control soil.
- Prepare a Phase 2 ESA report to document the results of the laboratory analysis.

2 BACKGROUND

2.1 Site Description

The Site is located at surface location Unit A, Section 01 Grid Area 60° 10', 123° 15', approximately 27 kilometers (km) southeast of Fort Liard, Northwest Territories. Access to the Site is from the west. A location map of the Site is included as Figure 1 and a survey plan is included in Appendix A.

2.2 Land Use and Receptors

The lease is situated on Crown land in a mixed-wood forested area. The Site has not been reclaimed, but natural encroachment from the surrounding forest is evident throughout the lease. An aerial photograph or satellite image of the quarter section is included as Figure 2. Site photographs are included as Appendix B.

2.3 Site History and Infrastructure

The Paramount et al Liard A-01 well was drilled between February 9, 1999 and March 19, 1999 to a depth of 2,046 m. The rig was released on March 25, 1999. The well was never put on production.

Infrastructure identified in association with the site includes only the wellhead. According to the Paramount June 2009 As-built sketch and survey plan, a 40 m x 60 m temporary campsite was located west of the wellsite on the north side of the road. There were no log decks, borrow pits or remote sumps identified in association with the wellsite.

2.4 Previous Environmental Work

A Phase 1 ESA was completed by North Shore in March 2017 (North Shore, 2017). There was a wellhead surrounded by a conductor barrel with grate paneling present on the site at the time of the February 2017 site visit conducted by North Shore. Based on the information gathered from the Phase 1 ESA records, and the February 2017 site visit, North Shore concluded that there was a potential for environmental impact associated with the Site. North Shore recommended intrusive sampling on the Site to assess the well centre and the on site drilling waste disposal area.

3 METHODOLOGY

3.1 Safe Work Procedures

North Shore personnel adhered to Paramount's policies and procedures to complete the assessment and investigation program. Standard oilfield personal-protective equipment (hard hat, steel-toed boots, safety glasses, and fire retardant coveralls) were worn by all personnel on-site. A calibrated four way gas monitor for H_2S, O_2, CO, and organic vapors was also carried by each person participating in the field work. Nitrile gloves were worn when handling soil samples. All personnel onsite were required to possess copies of the applicable safety certification (Paramount Orientation, Ground Disturbance Level 2, H_2S Alive, Transportation of Dangerous Goods, Workplace Hazardous Material Information System, and Standard Level First Aid). North Shore personnel acquired a Paramount Safe Work Permit prior to commencing fieldwork and a tailgate safety meeting was conducted at the beginning of each work day.

Prior to initiating any ground disturbance the proposed assessment area was swept twice by a third party company for the presence of buried facilities. The wellhead surrounded by a conductor barrel with grate paneling was the only facilities present at the time of assessment. All ground disturbance documentation was peer reviewed prior to commencing the fieldwork.

3.2 Drilling Program

On February 10, 2017 26 boreholes (17C01 through 17C02 and 17BH01 through 17BH24) were advanced as part of the drilling program (Figure 3). Boreholes were completed using a tracked B-57 drill rig equipped with 15 cm solid-stem augers. Boreholes were completed to a maximum depth of 6.0 mbgl (meters below ground level), depending on the assessment location and subsurface conditions.

Delineation of potentially impacted areas was based on field screening, visual cues, and professional judgment. Vertical and horizontal delineations were completed to determine the spatial extent of the potentially impacted material. If potentially impacted material was identified during borehole logging, vertical delineation was completed by sampling parameters above the suspected impact zone and to a depth of 1.0 m below the suspected lowest point of contamination. Horizontal delineation was completed by advancing boreholes in 5.0 m horizontal increments in each direction (north, south, east, and west) until clean material, as determined by field screening and professional judgment, was identified. Select delineation samples were collected for laboratory analyses. The GPS location, reference from a fixed point, and rationale of each borehole is included in the borehole logs in Appendix C.

3.3 Soil Sampling

Throughout the sample collection process, North Shore adhered to sampling procedures described in the Canadian Council of Ministers of Environment (CCME) Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites (CCME, 1993). Samples of the recovered soil were visually inspected for evidence of impacts such as free product, staining, or discoloration. The outermost layer of the samples was trimmed using a soil tool to avoid cross-contamination. North Shore personnel wore a pair of clean, chemical resistant nitrile gloves for each soil sample collected as an added preventative cross-contamination measure.

Soil vapor concentrations were field screened for volatile hydrocarbon constituents using an RKI Eagle gas detector (RKI Eagle), calibrated with a 400 parts per million (ppm) concentration of hexane gas with the methane elimination switch turned on. Samples selected for vapor screening were placed into plastic bags, sealed, agitated, and allowed to volatilize. Volatile organic compounds (VOCs) that accumulated within the headspace were then measured in ppm and recorded on the borehole logs.

Soil samples were also field screened for salinity related parameters by measuring electrical conductivity (EC) using a Spectrum Technologies Inc. Field Scout Soil and Water EC Meter (EC Probe). Prior to sampling, the EC probe was calibrated with a 2.76 dS/m calibration solution. Once the soil on the auger had been trimmed, the EC probe was inserted directly into the soil media in order to obtain an in-situ EC reading. The EC reading was allowed to stabilize for three seconds before being recorded in the field documents.

All soil samples were placed in sealable plastic bags for field screening organic vapors while 40 mL vials with methanol and 125 mL glass jars with Teflon-lined lids were used for organic analyses. Jarred samples were packed tightly to minimize headspace, help prevent the loss of VOCs, and minimize biodegradation. All samples collected were labeled and placed in a cooler with ice or ice packs to

maintain a temperature as close to 4°C as possible. Soil samples were transported to an accredited laboratory for analysis. Standard chain of custody protocols were followed during the transport of the samples.

Soil characteristics at each borehole location were described using classification procedures and terminology from The Canadian System of Soil Classification (Soil Classification Working Group, 1998).

3.4 Quality Assurance and Quality Control

3.4.1 Laboratory QA/QC

Soil samples collected during the February 10, 2017 sampling event were submitted to AGAT Laboratory (AGAT) in Calgary, Alberta for analysis. The analytical suite was selected based on regulated compounds that are typically found on oil and gas sites.

AGAT is a Standards Council of Canada (SCC), ISO 9000 Series and ISO/IEC 17025 accredited laboratory and Canadian Association of Environmental Analytical Laboratories (CAEAL) accredited laboratory that uses ESRD recognized methods to conduct laboratory analyses. Method blanks, control standards samples, Certified Reference Material (CRM) standards, method spikes, replicates, duplicates, and instrument blanks are routinely analyzed as part of the QA/QC program at the laboratory. AGAT has indicated that analytical data is only released if it passes the laboratory QA/QC procedures. A summary of the QA/QC procedures adopted by AGAT during the analyses of samples for petroleum hydrocarbon concentrations, salinity parameters, and metals concentrations is included in Appendix D.

4 COMPARISON GUIDELINES

4.1 Comparison Guidelines

Selection of the appropriate set of guidelines is based on the texture of the dominant soil type along with current and potential future land use as determined in the assessment. Where both fine and coarse grain strata are present, grain size is determined by the stratum governing horizontal and vertical migration to a receptor. Seven soil samples collected from depths ranging from 0.0 to 6.0 mbgl were analyzed for particle size (75 micron sieve). All seven samples were reported to be fine-grained. As a result, the guidelines for fine-grained soils were applied.

As per the direction of Paramount, the guidelines for residential/parkland land use were applied to the Site and laboratory values were compared to the following:

- Soil regulated metals, benzene, toluene, ethylbenzene, and xylenes (BTEX), and PHC fractions F1-F4 results were compared to the Canadian Council of Ministers of the Environment (CCME) - Tier 1 Soil Remediation Guidelines (CCME, 2017).
- Saturated paste boron and methanol results were compared to the AEP Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1 Guidelines; AEP, 2016a).

- Soil EC, Sodium Adsorption Ration (SAR) and pH values were compared to Environmental Guidelines for Contaminated Site Remediation (EGCSR, 2003) Environment Division. Government of the Northwest Territories (EGCSR, 2003).

4.2 Background Control Characterization and Salinity Guidelines

All control pH and EC results complied with the CCME and EGCSR Guidelines. Two of the seven control samples reported SAR values ranging from 6.70 to 7.70 that did not meet the EGCSR Guidelines. This is an indication that the soils in the area may have naturally elevated SAR values. All of the other control samples met the applicable remediation guidelines for SAR.

All seven of the control samples reported arsenic values ranging from 12.3 mg/kg to 16.1 mg/kg, which exceed the applicable remediation guidelines indicating the soils in the area have naturally elevated arsenic values. Three samples were analysed for zinc, and all met applicable guidelines. (Tables 2 and 3).

5 RESULTS OF FIELD INVESTIGATION

5.1 Stratigraphy

Based on the boreholes advanced during the drilling program, soil conditions generally consisted of clay over silty clay loam or hard clay to 6.0 mbgl.

5.2 Soil Results

Soil results for areas of concern are summarized in Sections 5.2.1 through 5.2.2. The laboratory analyses for soil samples are presented in Tables 1 through 3 along with the applicable comparison guidelines.

5.2.1 Well Centre

One borehole (17BH01) was advanced to assess the well centre area. Four soil samples (17BH01 0.8 – 1.0 mbgl, 17BH01 2.2 – 2.5 mbgl, 17BH05 2.2 – 2.5 mbgl, Dup B 0.8 – 1.0 mbgl) were analyzed for petroleum hydrocarbon, metal, and/or detailed salinity parameters. Sample 17BH01 2.2 – 2.5 mbgl exceeded applicable guidelines for zinc concentration with values of 475 mg/kg, and sample Dup B 0.8 – 1.0 mbgl reported a PHC F2 value of 321 mg/kg, which exceed applicable guidelines. Three soil samples (17BH01 0.8 – 1.0 mbgl, 17BH01 2.2 – 2.5 mbgl, Dup B 0.8 – 1.0 mbgl) exceeded the applicable guidelines for arsenic concentrations but were comparable to background concentrations. All of other samples met the applicable guidelines for hydrocarbon concentrations, metals, and detailed salinity parameters.

Five boreholes (17BH02 through 17BH06) were advanced to delineate impacts at the former well centre area. Four soil samples (17BH02 2.2 – 2.5 mbgl, 17BH03 2.2 – 2.5 mbgl, 17BH04 2.2 – 2.5 mbgl, 17BH05 2.2 – 2.5 mbgl) were analyzed for zinc, and one sample (17BH05 2.2-2.5 mbgl) for hydrocarbon analysis. All of the samples met the CSR Standards for hydrocarbon concentrations and metals parameters; the zinc exceedance was delineated both horizontally and vertically. At the time

of the assessment, visual observations and field screening did not indicate the potential for hydrocarbon impacts so delineation samples were not collected for PHC analysis. As such, the PHC F2 exceedance was not delineated.

5.2.2 Exploratory Boreholes

No visual indicators (i.e., subsided areas or atypical vegetation) were present during the Phase 2 ESA to suggest the possible location of the DWDA. Therefore, 12 exploratory boreholes (17BH07 through 17BH18) were advanced within a 30 m radius of the wellbore and six exploratory boreholes (17BH19 through 17BH24) were advanced in the corners of the lease in an effort to locate the potential DWDA. Field observations did not identify any suspect material which would indicate a DWDA was located on the lease.

Two soil samples (17BH09 1.7 – 1.9 mbgl and 17BH19 1.7 – 1.9 mbgl), which reported the highest field screening values for EC and VOCs, were analyzed for hydrocarbon and detailed salinity parameters. Sample 17BH19 (1.7-1.9) reported a SAR value of 5.39, which is comparable to control SAR values. All other samples reported values that met applicable guidelines.

5.3 Quality Assurance/Quality Control

Quality assurance and quality control for analytical data was also assessed by comparing analytical results from select samples to duplicate samples obtained from the same sample location. Primary and duplicate samples were compared and the relative percent differences (RPD) were calculated.

RPD criteria has been applied to field duplicates in order to evaluate the precision of the results. If both the original and duplicate sample concentrations are greater than or equal to five times the laboratory detection limit for a given parameter, the RPD must be less than or equal to 40% (water) and 60% (soils) (CCME, 2016). If the results lie outside of the range, they should be considered estimates only. The results of North Shore's QA/QC program are discussed in Section 5.3.1.

5.3.1 North Shore Environmental's QA/QC Program

Two soil sampling QA/QC measurements were conducted by duplicating soil samples 17C01 2.8 – 3.0 mbgl and 17BH01 0.8 – 1.0 mbgl. Laboratory comparisons reported good reproducibility for all benzene, toluene, ethylbenzene and total xylene (BTEX), petroleum hydrocarbon (PHC) (F1 – F4), particle size, metals, soluble ions, pH, EC and/or SAR values. The calculated RPD value for the fraction 2 hydrocarbons suggests that the sample shows poor reproducibility for the purposes of this project. It should be noted that all other parameters with criteria (BTEX, PHC (F1 – F4), metals, pH, EC and SAR) met the applicable criteria or were similar to natural background soil values. RPD value calculations and results for the QA/QC measurements are included in Tables 4 through 6.

6 SUMMARY AND CONCLUSIONS

North Shore completed a Phase 2 ESA on the Site on February 10, 2017. The assessment consisted of an investigation of the well centre, and the potential on site drilling waste disposal area. A total of 26 boreholes were advanced, including two control locations.

Two soil samples within the well centre area did not meet the applicable remediation guidelines for PHC F2 and zinc. The zinc exceedance was vertically and laterally delineated, however the PHC F2 exceedence was not delineated.

All of the remaining analyzed samples met the applicable remediation guidelines. Based on field observations and laboratory analysis, further work is required in order for the wellsite to meet the applicable remediation guidelines.

7 DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

8 CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

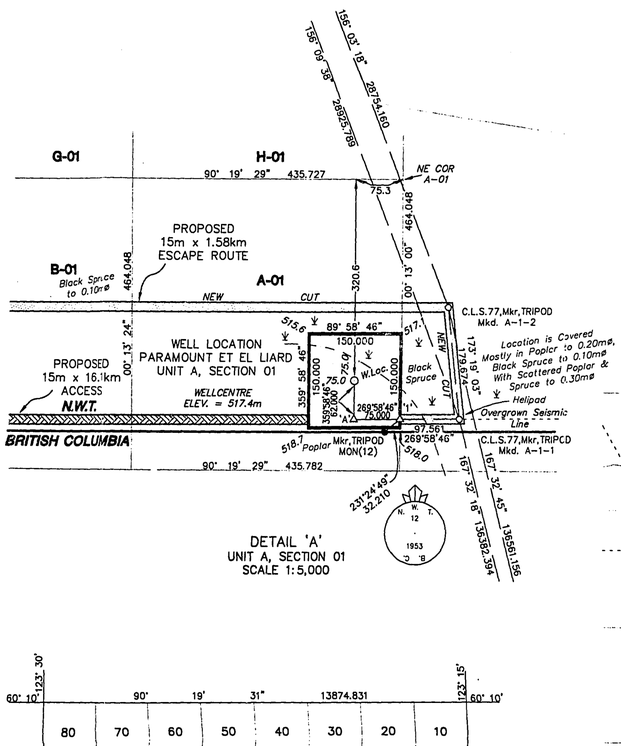
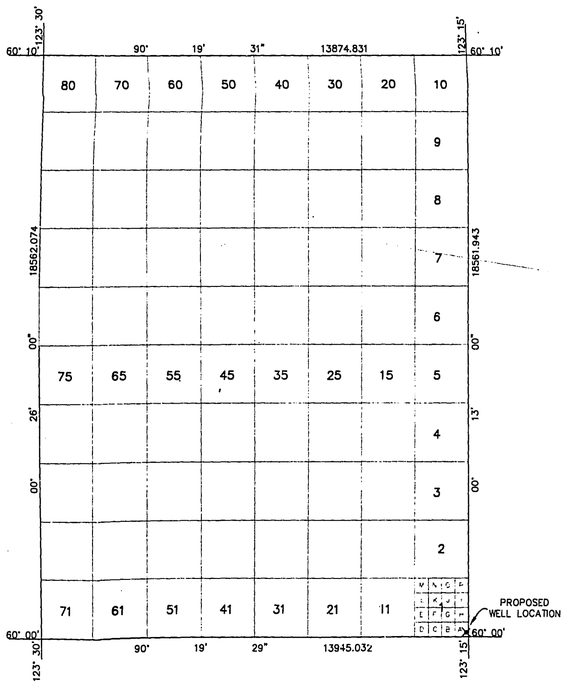
APPENDIX A

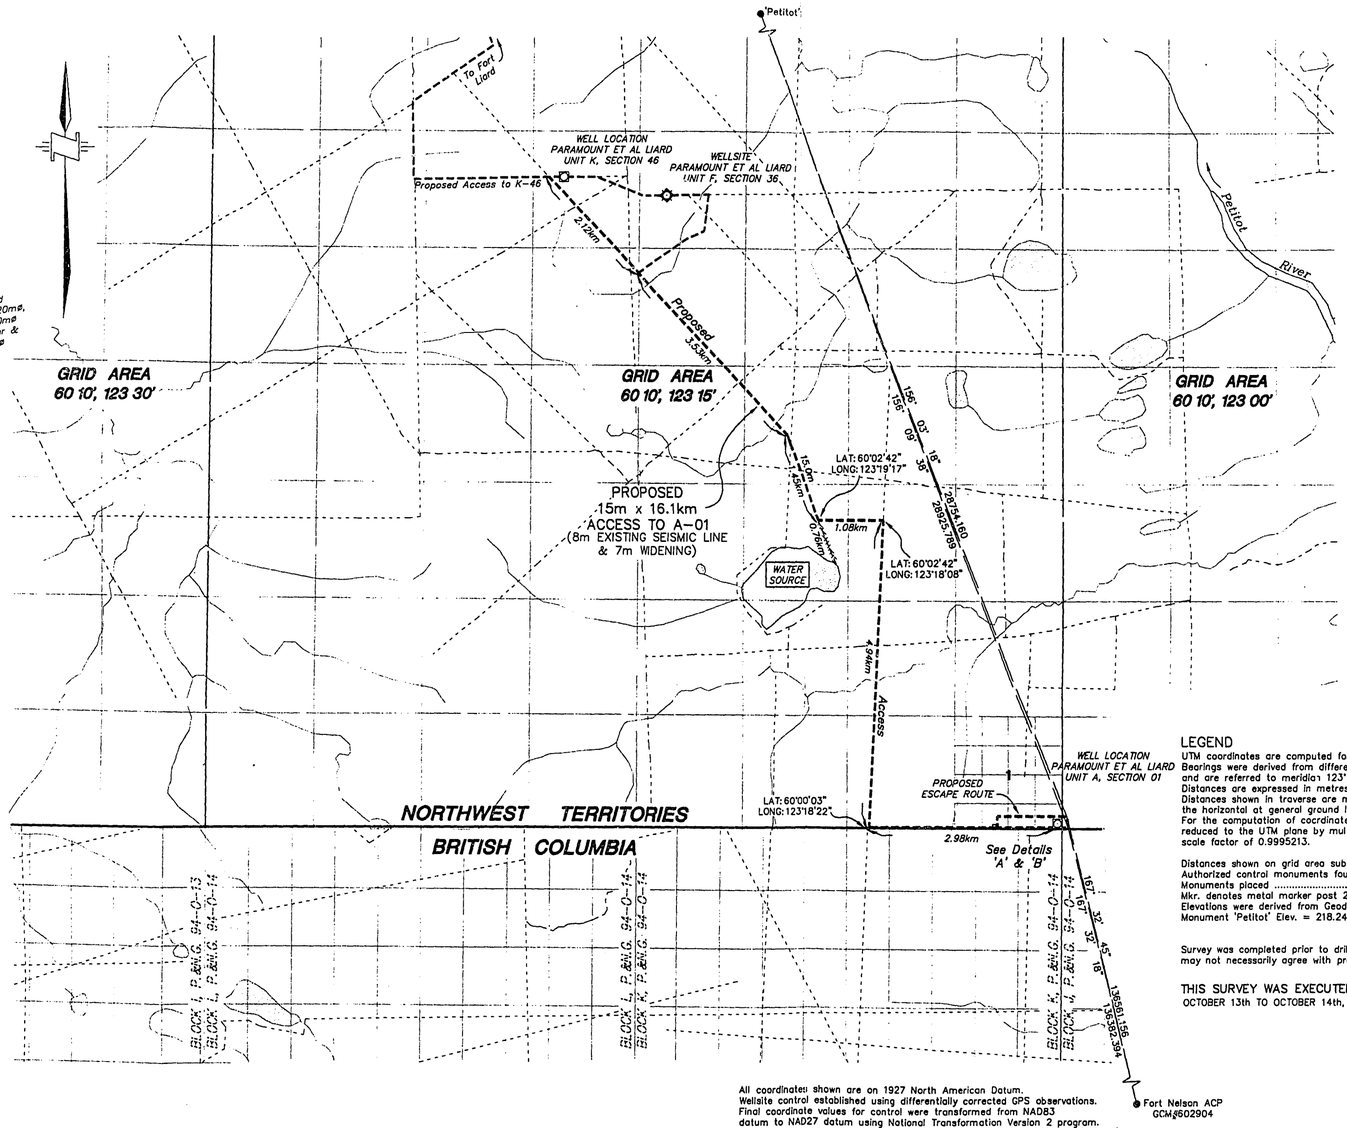
Survey Plan



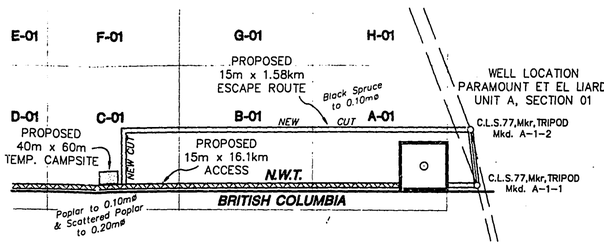
DETAIL 'A'
UNIT A, SECTION 01
SCALE 1:5,000



GRID AREA 60°10', 123°15'
SCALE 1:100,000



All coordinates shown are on 1927 North American Datum.
Wellsite control established using differentially corrected GPS observations. Final coordinate values for control were transformed from NAD83 datum to NAD27 datum using National Transformation Version 2 program. Geodetic Survey of Canada published coordinate values for monument 'Petitot' were held fixed. Adjusted values for Fort Nelson ACP GCM§602904 and comparison to Government of British Columbia published coordinates are shown below.



DETAIL 'B'
SCALE 1:10,000

AREAS REQUIRED:

WELLSITE:	150mx150m = 2.25 ha.
TEMP. CAMPSITE:	40mx60m = 0.24 ha.
ESCAPE ROUTE:	15mx1.58km = 2.37 ha.
ACCESS:	15mx16.1km = 24.2 ha.
TOTAL:	29.06 ha.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : W.V. JOHNSON, CLS
OCTOBER, 1998.

LEGEND

UTM coordinates are computed for Zone 10, central meridian 123° W. Bearings were derived from differentially corrected GPS observations and are referred to meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995213.

Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Petitot' Elev. = 218.241m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

THIS SURVEY WAS EXECUTED DURING THE PERIOD OCTOBER 13th TO OCTOBER 14th, 1998. BY W.V. JOHNSON, CLS

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Sworn before me at Fort St. John, this 18th day of October, 1998.

R.O. Blackall, CLS

SOIL ANALYSIS REVIEWED BY: Melinda Guay, Technical Reviewer

TRACE ORGANICS REVIEWED BY: Ngoc (Ruby) Vu, Lab Technician

DATE REPORTED: Mar 02, 2017

PAGES (INCLUDING COVER): 19

VERSION*: 3

Should you require any information regarding this analysis please contact your client services representative at (780) 395-2525

*NOTES

VERSION 3:Added total arsenic to samples: 366, 367, 368, 355, 357, 358 and total zinc to samples: 355, 357 and 358. Samples: 375, 378 and 396 were re-prepped and re-ran for arsenic and confirmed original values reported no data has been changed. Sample: 378 was re-prepped and re-ran for zinc and confirmed original value reported no data has been changed. Sample: 396 was re-prepped and re-ran for F2-F4 paramaters and confirmed original values reported. No data has been changed - March 2nd 2017 CS.

Version 2 supersedes version 1 issued on March 2nd 2017. Added total zinc to samples: 381, 383, 385, 387 and 390 - March 31st 2017 CS.

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8191355-8191396 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8191375-8191396 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen completed a Desktop Remediation™ (DTR) review of historical environmental site assessment information and data for the Paramount former wellsite *PARA ET AL* A-01-60-10-123-15 (the Site). The Site is in the South Liard field in the Northwest Territories.

The scope of work for the DTR involved reviewing and assessing available analytical data for the Site in order to determine the applicability of the receptor pathways at the Site. The only area of environmental concern (AEC) identified in the 2017 Phase 2 ESA for the Site was the wellbore area. The AEC information is presented in Section 5 of this report, along with the associated contaminants of concern (COCs) and relevant regulatory guideline information.

2. CURRENT SITE DESCRIPTION

The Site is a drilled and abandoned well, it was drilled to a depth of 2,046 meters between February 9 and March 19, 1999, in the South Liard field, approximately 60 kilometres (km) southwest of Fort Liard, Northwest Territories (NT). The Site location is presented on Drawing PAR6208-001.

The Site is approximately 150m x 150m, with a 40m x 60m campsite west along the access road. Site details and surrounding land uses are shown on Drawing PAR6208-002, and PAR6208-003. Table A, below, summarizes general information regarding the Site's location, topography, hydrogeology, and surrounding land uses.

TABLE A: Summary of General Information

Item	Description
Site Latitude & Longitude	60° 00' 04.30" N, 123° 15' 11.00" W
NTS Map	A-01 - 60°-00'-123°-15'
Well ID #	1858
Land Owner(s)	Crown
Drilling Dates	February 9 to March 19, 1999
Total Depth	2046 m
Site Description & Size	Site dimensions are approximately 150 m x 150 m, square aligned to the north, with access from the southwest.
Site Facilities	Wellhead was located at the centre of the Site;
Topography:	
Regional Surface Grade	The regional grade is gently sloping north (0-1%) towards the Liard River
On Site Drainage	The lease slopes northeast (0-1%) towards a low area northeast
Surface Cover	The Site is covered in grass vegetation. The forest is encroaching at the margins of the lease.
Geology	Bedrock geology consists of Wapiti Formation which is comprised fine clastic sedimentary rocks, Conglomerate, fine to coarse grained sandstone; carbonaceous shale and coal from cretaceous geological period [BCGS online map resource].
Hydrology & Hydrogeology:	
Nearest Surface Water	Government of NWT ATLAS website shows no water bodies within 500 m of the Site.
Water Wells	Government of NWT ATLAS website shows no water wells within 500 m of the Site (Appendix III).
Depth to Groundwater	Unknown
Groundwater Flow	Unknown but likely to the north towards the unnamed tributary of the Liard River
Surrounding Land Use (Site)	
North	Mixed wood forest to the northwest, and low muskeg area to the northeast

Item	Description
East	Mixed wood Boreal Forest
South	Mixed wood Boreal Forest
West	Access seismic line and mixed wood Boreal Forest

3. HISTORICAL REVIEW

The scope of this report included a review of available historical environmental site assessment (ESA) information for the Site. Findings from the review of the available reports are summarized below.

3.1 Phase 1 ESA - 2017

North Shore Environmental Consultants Inc. (North Shore) completed a Phase 1 ESA on the Site, published in March of 2017. The Phase 1 ESA indicated the well was a drilled and abandoned well from 1999, with a wellhead, conductor barrel and grate panel as the only structures present at the time of assessment. Based on Compliance Option #2 checklist, the drilling waste disposal area required assessment for exceeding the salt-loading and post-disposal oil concentration, and lack of documentation for the disposal of invert drilling fluid used in the well (North Shore, 2017a).

3.2 Phase 2 ESA - 2017

North Shore completed a Phase 2 ESA on the Site, published in May of 2017. The Phase 2 ESA investigated the wellbore and the drilling waste disposal area (DWDA) at the Site, and consisted of advancing 26 boreholes at the Site to a maximum depth of 6.0 meters below ground (mbg). Analytical results of soil samples collected during the Phase 2 ESA were compared to the following guidelines for the respective parameters: Canadian Council of Ministers of the Environment (CCME) 2017 Tier 1 Soil Remediation Guidelines for hydrocarbons; the 2016 Alberta Tier 1 Soil and Groundwater Remediation Guidelines for boron and methanol; and the 2003 Northwest Territories Environmental Guidelines for Contaminated Site Remediation for pH and salinity parameters (North Shore, 2017b). Results from the Phase 2 ESA showed elevated salinity and arsenic across the Site, comparable to background levels. Results from one duplicate soil sample collected from the wellbore area at a depth of 0.8-1.0 mbg, had a Fraction 2 petroleum hydrocarbon (F2 PHC) concentration above the applicable CCME guideline for the Site; as well, one soil sample collected from a depth of 2.2-2.5mbg from the same borehole advanced at the wellbore had a zinc concentration above the CCME guideline (North Shore, 2017b). The conclusion from the Phase 2 ESA was two soil samples collected from near the wellbore at the Site did not meet the applicable guidelines for F2 PHC and zinc, with the zinc exceedance delineated (North Shore, 2017b). Soil samples collected from the DWDA had concentrations of all parameters of concern below the applicable guidelines.

4. SUMMARY OF SITE SOIL CONDITIONS

Based on a review of historical reports, SynergyAspen developed a list of AECs for the Site. The AECs, along with contaminants of concern (COCs) and associated regulated parameters, are shown on Table B below. The AECs and their locations are shown in Drawing PAR6208-003, in the Drawings Appendix.

TABLE B: AECs and associated COCs in Soil

AEC Label	AECs	Impacted Borehole(s)	COCs (depth)
A	Wellbore	17BH01	Fraction 2 petroleum hydrocarbons (0.8-1.0mbg); Zinc (2.2-2.5mbg)

Soil Stratigraphy

There were two background boreholes advanced at the Site in the North Shore 2017 Phase 2 ESA. Soil stratigraphy at background borehole 17C01 was topsoil and hard clay to 2.5mbg, overlying sandy clay-loam to 4.2mbg, and hard clay to 6.0mbg, the total depth of assessment. In background borehole 17C02, the stratigraphy was described as silty-clay loam to 2.6mbg, overlying had clay to 4.0mbg, overlying sily-clay loam, to 4.5mbg, the total depth of assessment. The stratigraphy at the wellbore APEC was determined in 3 boreholes 17BH02, 17BH03, and 17BH04, and was described as clay to 3.0 mbg, the maximum depth of assessment. In 17BH01, the soil profile was described as clay to 2.2mbg, overlying hard clay to 3.0mbg, and silty-clay loam to 4.5mbg; in 17BH05, the soil profile is shown as clay to 1.4mbg, overlying sandy-clay loam to 2.6mbg, and silty-clay loam to 4.5mbg, the maximum depth of assessment.

Hydrogeology

Seven soil samples collected at varying depths from the background boreholes were analyzed for grain size analysis, by sieve. The sieve method provides the percentage split between coarse and fine-grained material based on retention on a 75µm mesh screen sieve. The grain size analysis results ranged from 2% to 33% retention on the sieve, indicating that fine-grained material was dominant at the Site (North Shore, 2017b).

The shallow subsurface regional geology of the area north of Maxhamish Lake was reviewed through borehole logs from Phase 2 ESAs completed at four sites in the region. The borehole logs were from sites located respectively approximately 7200m south, 6000m south-southwest, 2600m southwest, and 3400m east-southeast of the A-01 Site. The borehole logs from the following sites were reviewed:

- PARA ET AL MAXHAMISH B- 21-K/094-O-14 (WA#03717) (North Shore, 2017c)
- PARA ET AL MAXHAMISH B- 043-K/094-O-14 (WA#12563) (North Shore, 2017d)
- PARA ET AL MAXHAMISH B- 083-K/094-O-14 (WA#13773) (North Shore, 2017e)
- PARA ET AL MAXHAMISH A-96-J/094-O-14 (WA#13772) (North Shore, 2017f)

Soil stratigraphy at the b-21-K/94-O-14 site was topsoil and silty-clay overlying clay subsurface. Delineation boreholes around the site showed clay overlying hard clay, with minor occurrences of sandy loam. Hydraulic conductivity testing was completed at the site from 3 groundwater monitoring wells installed during the Phase 2 ESA: hydraulic conductivity values ranged from $1.0x10^{-9}$ meters per second (m/s) to $2.0x10^{-10}$ m/s, as expected from the soil type at the site (2017c).

The soil profile at background locations at the b-043-K site showed loam surface soil to 0.2m, overlying clay-loam soil to approximately 3.0mbg, followed by silty-clay-loam to 4.5mbg, and silty-loam to 6.0mbg. All samples from various depths submitted for grain-size analysis through sieve analysis showed fine-grained soils dominant in the soil profile at the site (North Shore, 2017d).

The borehole logs from background locations at the b-083-K and A-96-J sites showed consistent profiles with loam surface soil to 0.2mbg, followed by clay to approximately 3.0 mbg, overlying “hard clay” to 6.0mbg, the maximum depth of investigation; a layer of silty-clay was noted in one borehole from the a-069-J site. A sand layer was noted in one borehole from 2.4-2.8 mbg at the b-083-K site. All samples submitted for grain-size analysis through sieve analysis from both sites showed fine-grained soils dominant in the soil profile at the sites (North Shore, 2017e,f). Copies of the reviewed borehole logs and figures are provided in Appendix I and II.

From the Phase 2 ESA for the Site and hydraulic conductivity information the region, there was a sufficient minimum confining layer present between the Site and a deeper regional aquifer. Hydraulic conductivity values of the deeper soils at the Site would be expected to be low due to the hard clay soil at the Site. Therefore, drinking water (DW) standards would not apply at the Site within the shallow soils, but would apply in the deeper aquifer unit, if present. At the time of the assessments there were no water wells or residences within 500m of the Site.

5. ENVIRONMENTAL REGULATORY FRAMEWORK

Numerical soil standards for evaluating the results of the Phase 2 ESA were based on the CCME 2018 Canadian Environmental Soil Quality Guidelines (the CESQ), and the Northwest Territories Environmental Guidelines for Contaminated Site Remediation (the Environmental Guidelines) (Minister of the Environment and Natural Resources [ENR], 2003). The selection of applicable guideline limits in both documents are dependent upon site conditions, applicable receptors at a site, and relevant exposure pathways. From the land use definitions and soil depth considerations in the guideline documents, the following criteria were used to evaluate the 2017 Phase 2 ESA results for the Site:

- Residential / Parkland land use (RES) for surface soil, samples from 0.0 to 1.5 mbg;
- Residential / Parkland land use (RES) for sub-surface soil, samples from >1.5 mbg.

For assessment of the available data for the A-01 Site, the *Tier 1 – Criteria-Based Approach* described in the Environmental Guidelines was used to determine the applicable guidelines for PHC concentration limits, and the CESQ guidelines were used to determine the applicable zinc concentration limits for the Site.

For the evaluation of receptors and pathways related to groundwater protection, water use determination considered proximity to potable water and aquatic receptors, current and potential future use of groundwater aquifers as water sources, and the potential for groundwater extraction based on the low hydraulic conductivity of the shallow soils. From the Site information in Section 2, there were no groundwater wells, water bodies, or residences within 500m of the Site. Based on the rationale in Section 4 regarding low hydraulic conductivity due to fine-grained soil at the Site, and the lack of water bodies, water wells, or residences in the vicinity, the Protection of Potable Groundwater, Protection of Freshwater Aquatic Life, and Protection of Livestock Watering pathways would not be operative at the Site.

The following receptor pathways were determined to be applicable at the Site:

For Analytical Results from Soil Samples <1.5mbg:

- Direct Contact; and,
- Ecological Soil Contact.

For Analytical Results from Soil Samples >1.5mbg:

- Ecological Soil Contact; and,
- Nutrient and Energy Cycling check.

5.1 Guideline Derivation

From the evaluation of receptor pathways at the Site, the Protection of Potable Groundwater pathway was not applicable at the Site. Therefore, the guideline limit for F2 PHC in fine-grained surface soil was determined to be 900 milligrams per kilogram (mg/kg), based on the ENR *Tier 1 Criteria-Based Approach*.

The applicable guideline limit for zinc in fine-grained sub-surface soil in residential land use was determined to be the 2018 CCME Human Direct Contact limit of 10,000 mg/kg. The limit is based on the depth of the zinc exceedance at 2.2-2.5mbg, which is:

- Below the usual root zone of rooting plants, therefore outside the Nutrient Cycling pathway (350 mg/kg);
- Below the depth at which Soil Contact (200 mg/kg) would reasonably be considered to occur without mechanical excavation.

6. COMPARISON OF DATA

Based on the 2017 Phase 2 ESA, soil analytical results were compared to the applicable guideline limits with respect to the operative receptor pathways at the Site. The ENR *Tier 1 Criteria-Based Approach* was considered for the Site by excluding Protection of Potable Water, Protection of Aquatic Life, and Livestock Watering pathways. Table C shows the current applicable soil guideline for surface soil, and the change in the guideline limit based on the operative receptor pathways at the Site:

TABLE C: Surface Soil Quality Guidelines applicable at the Site (mg/kg)

Parameter	ENR (< 1.5m)	Analytical Results (mg/kg)	Tier 1 Level (mg/kg)*	Pass / Fail
F2 PHC	150	321	900	Pass

*Tier 1 Criteria- Based Approach

Table D below shows the current applicable soil guideline for surface soil, and the change in the guideline limit based on the operative receptor pathways at the Site:

TABLE D: Subsurface Soil Quality Guidelines applicable at the Site (mg/kg)

Parameter	ENR (> 1.5mbg)	Analytical Results (mg/kg)	CCME Removed Pathways**	Pass / Fail
Zinc	200	475	10,000	Pass

**excluding Environmental Soil Contact and Nutrient Cycling.

Based on the above results comparing historic soil data to site-specific standards, the impacts as noted in 2017 were below the guideline limits applicable at the Site. Further discussion is included in the next section.

7. RESULTS AND CONCLUSIONS

Single exceedances for F2 PHC and Zinc were noted in 2 samples from 17BH01, at the Wellbore at the Site. Analytical soil data from the 2017 North Shore Phase 2 ESA were compared to the current ENR and CCME guidelines applicable to the Site. A discussion of the results is presented below.

7.1 Soil Results

7.1.1 Fraction 2 PHC

There was a single F2 PHC exceedance in a duplicate sample from 17BH01, with a concentration of 321mg/kg, from 0.8-1.0mbg at the Well Center. The original sample from 17BH01 was identified with a F2 PHC concentration below the standard, contrasted to the duplicate sample with an F2 PHC exceedance. The difference in results is likely due to sample heterogeneity.

Comparing the results to the ENR guideline for PHC in surface soils, with the Protection of Groundwater pathway removed, the sample result was below the surface soil guideline of 900mg/kg. Therefore, the result did not present a risk to groundwater receptors at the Site.

Additionally, If there was a spill or release leading to the single exceedance for F2 PHC, contamination from other chemicals would be expected, including other hydrocarbon constituents, sodium and/or chloride. As no other contaminants of concern were encountered in the sample, it was unlikely that the elevated F2 concentration at the Well Center was the result of a spill or release.

Based on the above rationale, the minimal F2 impact at Well Center did not pose a risk to receptors at the Site.

7.1.2 Zinc

There was a single soil sample that had an exceedance for Zinc, with a concentration of 475mg/kg, from 2.2-2.5mbg at the Well Center. Comparing the results to the CCME guideline for Zinc in subsurface soils, with the Soil Contact and Nutrient Cycling pathways for Environmental Health removed due to the depth of the sample, the result was below the Human Health Direct Contact guideline of 10,000mg/kg, applicable at the Site.

Referring to fact sheets and guidance from the CCME and ENR, a discussion regarding application of guidelines for Zinc with respect to the site-specific conditions follows:

- The Site is not currently occupied by humans and the Site is unlikely to be occupied by humans in the future. While the zinc concentration in one soil sample at the Well Center was above the guideline limit for Environmental Soil Contact and Nutrient Cycling, the depth of the impact at 2.2-2.5mbg was below the rooting depth for plants, and at a depth that would require mechanical excavation to expose the impacted soil.

- The mobility of zinc is dependent mainly on the pH of the soil at the Site. For all samples, the pH at the Site was above 7.0, under which conditions Zinc will tend to stay adsorbed to soil colloids, and leaching of Zinc from soil is prevented. Therefore, the zinc in soil at the Site would be unable to migrate a significant distance from the Site. In order to pose a potential risk to freshwater aquatic life, zinc at the Site would have to migrate to the nearest surface water body: a potential stream, located > 500 m of the Site. Considering the low-permeability silts and clays in the area, and the associated low hydraulic conductivity values ranging from 1.0x10-9 meters per second (m/s) to 2.0x10-10 m/s, the migration of adsorbed zinc would not reasonably be expected to pose a risk to the aquatic receptor.

- The Site is in a remote setting where access is limited to helicopter transport or winter roads, and identifies with Industrial land uses, over Residential/Parkland. Toddlers or the public are not expected on a regular basis at the Site, in contrast to the models for guideline development for residential/parkland areas.

- If removal of the single elevated Zinc exceedance was undertaken, the heavy equipment used to excavate the soil would likely cause significant impacts to the conditions at the Site compared to the low risk to the environment that may be imposed by the metals remaining in-situ.

- Elevated zinc concentration were not identified in other samples across the Site. Besides, Zinc mud additives were not noted in the mud list.

- No other elevated concentrations of metals, hydrocarbons or salinity parameters were encountered in this sample.

- Further rationale includes that if there was a spill or release leading to the single exceedance for Zinc, contamination in soil from other chemicals, including other hydrocarbon constituents, sodium or chloride, would be expected. Therefore it was unlikely that the elevated Zinc concentration at the Well Center was the result of a spill or release.

Further rationale includes that if there was a spill or release leading to the single exceedance for Zinc, contamination in soil from other chemicals, including other hydrocarbon constituents, sodium or chloride, would be expected. Therefore, it was unlikely that the elevated Zinc concentration at the Wellbore was the result of a spill or release.

Based on the above rationale, the single Zinc exceedance detected in one subsurface soil sample from the Well Center at the Site does not pose a risk to human and ecological receptors at the Site.

7.2 Conclusions

Based on a comparison of results from the 2017 Stage 2 PSI and 2019 Groundwater Monitoring by North Shore, the historic data showed results were below the ENR and CCME guidelines applicable at the Site.

As a result of the evaluation of the historic data, all sample results met the guidelines applicable to the Site. Therefore, no further environmental work is required at the Site prior to submission of the report to the ENR.

8. CLOSURE

Thank you for the opportunity to conduct the work presented herein. If you have any questions or comments, please do not hesitate to contact the undersigned at 250-785-1030.

10. USER RELIANCE AND GENERAL LIMITATIONS

10.1 User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited (the Client). The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

10.2 General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

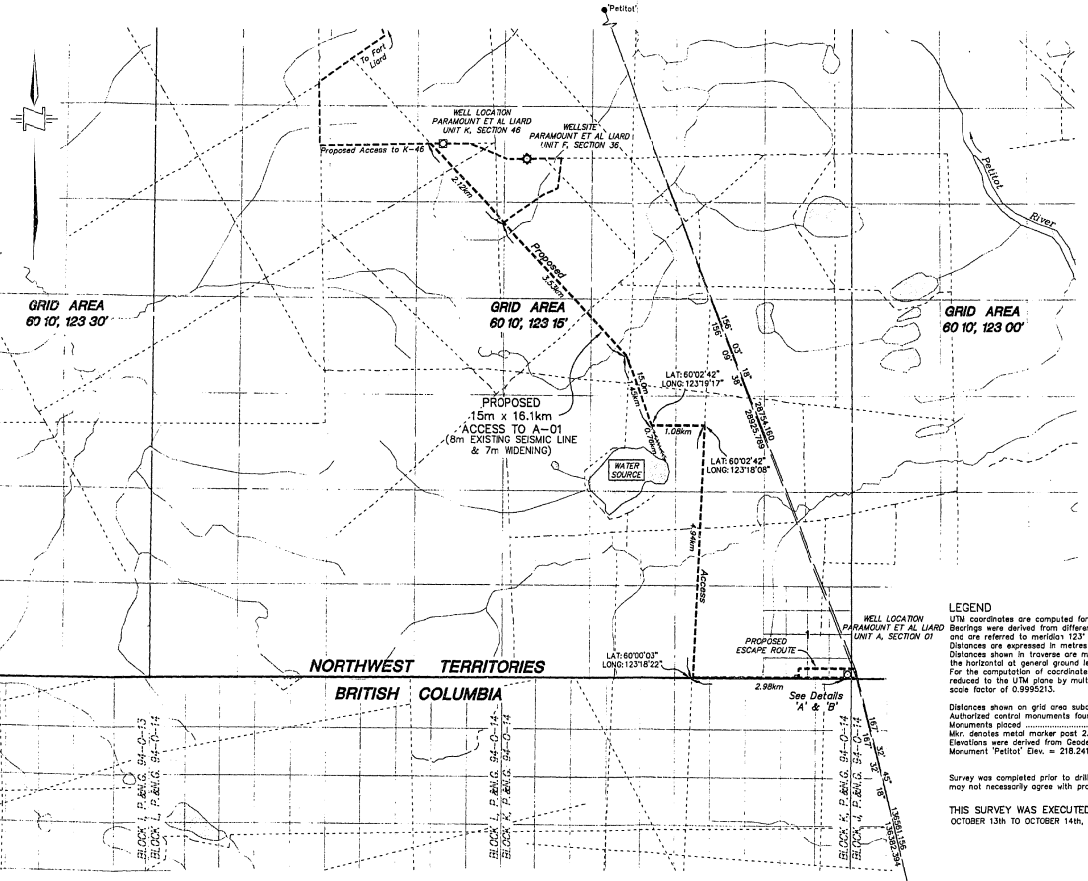
GRID AREA 60°10', 123°15'
SCALE 1:100,000



All coordinates shown are on 1927 North American Datum.
Wellsite control established using differentially corrected GPS observations. Final coordinate values for control were transformed from NAD83 datum to NAD27 datum using National Transformation Version 2 program. Geodetic Survey of Canada published coordinate values for monument 'Petitot' were held fixed. Adjusted values for Fort Nelson ACP GCM602904 and comparison to Government of British Columbia published coordinates are shown below.

OCTOBER, 1998.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS observations and are referred to meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995213.

Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Petitot' Elev. = 218.241m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

THIS SURVEY WAS EXECUTED DURING THE PERIOD OCTOBER 13th TO OCTOBER 14th, 1998. BY W.V. JOHNSON, CLS

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that: I have in my own paper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Sworn before me at Fort St. John, this 18th day of October, 1998.

R.D. Blackall, CLS

INTRODUCTION

Paramount Resources Ltd. (Paramount) retained North Shore Environmental Consultants Inc. (North Shore) to conduct a Phase 1 Environmental Site Assessment (ESA) for the Para et al Liard F-36 gas well located in the Northwest Territories (NWT) at Unit F, Section 36 Grid Area 60° 10', 123° 15' (Site).

The purpose of the Phase 1 ESA was to assess and qualify potential environmental concerns associated with the Site through a historic records review and site visit. The Phase 1 ESA was conducted in general accordance with the Canadian Standards Association (CSA) *Standard Z678-01: Phase I Environmental Site Assessment* (CSA, 2001). The Alberta Energy Regulator (AER) *Assessing Drilling Waste Disposal Areas: Compliance Option for Reclamation Certification* (AER, 2014) guidelines were used to assess the drilling waste associated with the Site.

FINDINGS

The Para et al Liard F-36 well was drilled over two winter seasons. It was spud on March 3, 1998 and drilled until March 28, 1998 to a depth of 1494 metres. Drilling was stopped due to spring break-up and deteriorating road conditions. Drilling of the main hole was completed the following winter between December 23, 1998 and February 5, 1999 to a final depth of 2110 metres. The well produced sweet natural gas, condensate and produced water between 2000 and 2005 before the site was deactivated by Paramount in April 2008. Fluids were transported from the site via pipeline to the Paramount Maxhamish d-36-I compressor station in BC. The wellsite is accessible by helicopter and winter roads.

Infrastructure identified in association with the site includes the following: wellhead, two pipe racks, radio tower, meter building, two separator skids, methanol tank within a 1 m high steel containment, aboveground storage tank (AST) in secondary containment, flare knockout drum with vent stack, pig launcher, surface piping, risers, fuel tank and other various chemical barrels and tanks. The Paramount June 2009 As-built plan of the area shows a decking site and borrow pit were located southeast of the wellsite. It is not known for certain if these were cleared in association with the wellsite. A 30 m by 60 m campsite was noted on the survey plan to the east of the wellsite. There were no remote sumps identified in association with the wellsite.

<u>March 1998 Drilling Event (0-1494m)</u>

The surface and intermediate hole sections of the well were drilled using a gel-chem drilling mud. According to documentation completed by Chiron Technologies Inc., the drilling waste associated with the original drilling event was disposed of on site by mix-bury-cover and pump-off to the north of the lease. The sump was located northwest of well centre. Formal drilling waste disposal documentation was not available for review and as a result a Compliance Option 2 checklist and associated calculations were completed as per the *Assessing Drilling Waste Disposal Areas: Compliance Options for Reclamation Certification* document (AER, 2014). The drilling waste meets the requirements of the checklist and associated calculations and no further assessment of the drilling waste disposal area is required.

December 1998-February 1999 Re-entry Event (1494-2110m)

The main hole section of the well was drilled using a nitrified calcium chloride invert mud system. There was no information in the available documentation reviewed with respect to how or where the main hole drilling waste was disposed of. As a worst case scenario, it is assumed that the drilling waste was disposed of on site. The drilling waste does not meet the requirements of the Compliance Option 2 checklist and associated calculations and further investigation of a potential on site drilling waste disposal area is required.

Drill stem tests (DSTs) #1-3 were conducted during initial drilling operations in March 1998 recovering drilling mud and gasified mud. DST's #4-8 were conducted during the well re-entry recovering mud, gassy inhibited water and gassy watery invert. The Chiron Technologies Pump-off/Lease Diagram shows a flare pit was located on the east side of the lease. The DST reports noted 'vent contents to flare' and 'chamber left open to the pit' during DST testing and as a result further assessment of the drilling flare pit is required.

Spills & Complaints

A review of the NWT Resource Wildlife and Economic Development's Hazardous Material Spill Database identified the following spills associated with the F-36 wellsite:

Spill No.	Date	Spill Location	Product Released	Volume	Source
2003739	December 10, 2003	F-36 Pipeline ROW	Condensate Water	40 L	Pipe or Line
2003662	November 3, 2003	F-36 Wellsite	Condensate & Produced Water	1000 L	Storage Tank < 4000 L
2001359	November 21, 2001	F-36 Wellsite	Condensate Water	150 L	Storage Tank < 4000 L
2001099	April 1, 2001	F-36 Wellsite Riser for 4" Pipeline	Methanol Water	10 L	Pipe or Line
2001071	March 8, 2001	F-36 Wellsite	Glycol	12 L	Drum or Barrel

The Alpine Environmental (Alpine) Annual 2005 Environmental Site Assessment Report indicated that an area of stained gravel was previously noted in the area of the flare stack in 2004 and a small amount of staining was present near the wellhead.

An NWT Spill Report identified on off lease spill along the access road into the F-36 wellsite between January 21 and 23, 2000. It was estimated that 800 L of waste was released on the access road during rig move events and accumulated in two low spots along the road; however the exact locations are not known. There was contradicting information available with respect to the type of material released. One spill report indicated that the spill material may have contained hydrocarbons and had a hydrocarbon odor while another spill report identified the material as drilling fluid. Snow was windrowed to the road center and then cleaned up and taken to the remote drilling waste lined sump at O-35.

The July 30, 2013 Aboriginal Affairs and Northern Development Canada Environmental Inspection Report noted staining on the ground beside one of the fuel containment berms and the wellhead. Hydrocarbon material was present on one side of the fuel containment berm indicating that it had overflowed. Old spill pads were noted littered on the site.

Previous Assessments/Reports

Alpine completed an Annual ESA report in October 2005. The assessment was conducted to visually inspect the wellsite for signs of environmental impact and note changes in site conditions compared to previous site visits. The Alpine report references an April 22, 2004 report entitled *Vent Stack Release – Fort Liard Re: INAC Spill Numbers 01-739 and 03-662.* The report contained results with respect to biopile and associated flare stack excavations and indicated impacts remain in-situ at the base of the flare stack; however, a formal copy of the report could not be obtained from available company records.

In January 1998, Golder Associates Ltd. and Western Oilfield Environmental Services Ltd. completed an Environmental Impact Assessment for the Fort Liard Additional Exploratory Drilling Project. The assessment was conducted to meet the requirements of the Canadian Environmental Assessment Act.

Interviews

There were no Paramount operations personnel with historic knowledge of drilling or production activities at the Site available for an interview. The assessment was conducted to meet the requirements of the Canadian Environmental Assessment Act.

Site Visit

A site visit was conducted on February 1, 2017 under snowy conditions. Dead vegetation identified on site from the previous year's growing season consisted of spruce, birch, willow, cattail, fescue, brome and dock. The wellsite was surrounded by spruce, birch, willow, fescue and brome. A lagoon was observed on the northeast portion of the site and a subsided area with cattails was noted on the southwest side of the lease. A berm surrounded the well pad and a 20 m cut on the north side of the wellsite was used to fill the southern half of the lease. Erosion from water run-off was evident throughout the site. Infrastructure present on the lease at the time of the assessment included a 400 bbl tank in containment, 3 ASTs in containment containing corrosion inhibitor, radio tower, electrical boxes, flare knock-out tank, above and below ground pipelines, flare stack, three shacks and pipe racks and pilings throughout.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information gathered for this Phase 1 ESA from the historic records review and the site inspection, North Shore concludes that there is a potential for environmental impact in connection with the site. A Phase 2 ESA is recommended to assess the following areas of potential concern:

- Well centre;
- Production facility/former spill areas;
- Flare stack area;
- Potential drilling waste disposal area associated with the well re-entry, including the former sump area on the northwest portion of the site; and
- Drilling flare pit area.

DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

In the preparation of this report, selected Alberta Energy Regulator (AER) reference material has been gathered from AbaData™ (property of Abacus Datagraphics Ltd.), which is an online information source. The information provided by AbaData is received directly from the AER, electronically updated on a monthly basis and is assumed to be correct.

CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : W.V. JOHNSON, CLS
NOVEMBER, 1997.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995232.

Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Traverse Hub placed ..... △
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Petitot' Elev. = 218.241 m
Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Brent,

I have included a table below that shows the annual production statistics gathered by the NEB for the Fort Liard fields.

There are four fields:

- Liard Wells: Liard F-25A, K-29, M-25, 2K29, 3K-29, 2M-25, K29A
- Liard North Wells: North Liard P-66A
- Fort Liard SE Wells: SE Fort Liard N-01
- Fort Liard Wells: Fort Liard F-36, O-35

There is monthly data by well, but it would take me a while to compile the historical records for release. Please let me know if this information suits your purpose, and feel free to call if you have any questions.

Brent,

Thanks for sending the specifics. If the information is readily available, we may have it in a few days, but it can sometimes take a couple of weeks if it has been archived.

In the meantime, I have found production reports for 2005 and 2006. I will see what information I can send you from those reports.

- Kristen

Subject: RE: Looking for Production Information

Hi Kristen,

Thank you for the quick response. The production records that we are looking for are from the early 2000's. Specifically, we are looking for information for the Paramount Resources wells O-35, N-01, I-46, F-36, and A-01. From the information we currently have it looks like these wells produced between 2002 and 2007. I believe there will only be production information for F-36, O-35, and N-01. The other two wells were drilled and abandoned.

Would you be able to see if there are production records for these wells?

Thanks,

Brent

Subject: RE: Looking for Production Information

Hello, Brent,

Thank you for contacting OROGO. As of April 2014, the Regulator has jurisdiction for the regulation of oil and gas works and activities in the onshore Northwest Territories (NWT), with the exception of the Inuvialuit Settlement Region and lands that were not transferred from the Government of Canada to the Government of the Northwest Territories.

Production statistics by field for 2014, 2015, and 2016 are available on our website at www.orogo.gov.nt.ca on the 'Documents' page. The files are listed alphabetically. *Production Statistic Reports* are on page 3, and there is one document for each year. However, all production since 2014 has been from the Cameron Hills field. There has been no recent production in the Fort Liard area. If you need historical production data, let me know and I will see if we can obtain it.

Please feel free to call me if you have any questions.

Subject: Looking for Production Information

Hi Kristen,

North Shore is currently completing Phase 1 ESAs for some wellsites in the Fort Liard area. We are relatively new to working in the Northwest Territories and we are trying to track down production information for the wells. Would this information be available in the OROGO Public Registry? Any help or information that you can provide would be greatly appreciated.

Thanks,

Brent

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information:

Unique Identifier (UI)	Para et al Liard F-36
Spud Date	March 3, 1998
Well Depth	1494 m

1.1 Disposal Method (if known)*: Mix-bury-cover and pump-off

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: On site, northwest of well centre

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.

For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☒	☐
If yes, were the disposal areas separate from one another?	☒ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☐ ☐ ☐ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☒ ☐ ☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☒ ☐	☐ ☐ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☒	☐ Phase 2 required ☐ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☐	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used?	☐	☒
If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required

	Yes	No
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required

	Yes	No
3.3 Was zinc carbonate added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ ☐ Show calculation on attached form	☒ ☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*? If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available? If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐ ☐ ☐	☒ ☐ Phase 2 required ☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling? If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐ ☐	☐ ☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☒ Show calculation on attached form	☐ Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Surface & Intermediate Hole Drilling Mud Additive List (0 - 1494 metres)

Product Name	Amount Used	Brief Description of Product
Gel	1091	Viscosifier
Envirofloc	17 sacks	Flocculant
Barite	218 sacks	Weighting Material
Lignite	21 sacks	Thinner/Dispersant
AquaPac	17 sacks	Viscosifier
SAPP	2 sacks	Thinner/Dispersant
Bicarb of Soda	1 sack	Alkalinity pH Control
Caustic Soda	21 sacks	Alkalinity pH Control
Desco	1 sack	Chrome-based Thinner/Dispersant
Detergent	3 pails	Surface Active Agent
Sawdust	62 sacks	Lost Circulation Material
Vis-Plus	1 sacks	Viscosifier
Soda Ash	2 sacks	Calcium Remover

Reference Documents (List all source documents used in the completion of this checklist. Attach additional pages if necessary. Documents must be supplied to the AER if requested.)

Concord Drilling Fluids Ltd. Well Data Recap & Summary
Paramount Resources Ltd. Daily Drilling Report
Chiron Technologies Inc. Drilling Waste Analysis Form & Pump-off/Lease Diagram
Paramount Well File Information
Mackenzie Valley Land and Water Board – Public Registry – Online Review System

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

According to documentation completed by Chiron Technologies Inc., the drilling waste associated with the original drilling event was disposed of on site by mix-bury-cover and pump-off to the north of the lease. The sump was located northwest of well centre. Formal drilling waste disposal documentation was not available for review and as a result a Compliance Option 2 checklist and associated calculations were completed.

The drilling waste meets the requirements of the checklist and associated calculations and no further assessment of the drilling waste disposal area is required.

A separate Compliance Option checklist has been completed for the drilling waste associated with the December 1998-February 1999 well re-entry.

Location: Para et al Liard F-36 **Spud:** 3-Mar-98

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50* , *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
218	÷	1494	÷	3	=	0.049	Meets

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Location: Para et al Liard F-36 **Spud:** 3-Mar-98

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
1	÷	1494	÷	3	=	0.000223115	Meets

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Location: Para et al Liard F-36 **Spud:** 3-Mar-98

Salt Calculations for Option 2:

Alternative 2

If the volume of drilling waste is not known, use the following calculator to determine the NaOH Equivalent Sacks per metre of well depth. This value must be less than **0.0260** for wells drilled before October 22 1996, or **0.0350** for wells drilled on or after this date. If the value exceeds the target, a Phase 2 ESA (Compliance Option 3) must be conducted.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda	21	X	1.00	=	21
Soda Ash	2	X	0.75	=	1.5
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate	1	X	0.95	=	0.95
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)	2	X	0.22	=	0.44
Calcium Chloride		X	0.72	=	0
Calcium Nitrate		X	0.34	=	0
Envirofloc	17	X	0.41	=	6.97
Gypsum**		X	0.59	=	0
Lime**		X	1.08	=	0
** Max = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns	14.86780164	X	0.68	=	10.11010511

Total NaOH Equivalent Sacks	=	40.97010511
Well Depth (m)	÷	1494
NaOH Equivalent Sacks per Metre	=	**0.0274**

Result

Meets

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

Drill Stem Test Return Calculations for Compliance Option Two

Location: Para et al Liard F-36 **Spud:** 3-Mar-98

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
84.8	8.5	0.047982214	x	2000	÷	7600	=	0.0126269
84.8	80	0.451597312	x	250000	÷	7600	=	14.8551747
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
				Total number of sacks			=	14.8678016

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

= Required Field

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information:

Unique Identifier (UI)	Para et al Liard F-36 Re-entry
Spud Date	December 23, 1998
Well Depth	2110

1.1 Disposal Method (if known)*: Unknown

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: Unknown

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.

For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☒	☐
If yes, were the disposal areas separate from one another?	☒ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☐ ☐ ☐ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☒ ☐ ☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐ ☐	☒ ☒ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☒	☐ Phase 2 required ☐ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☐	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used?	☒	☐
If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒ Phase 2 required

	Yes	No
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☐	☐ ☒ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required

	Yes	No
3.3 Was zinc carbonate added to the drilling fluid?	☐	☒
If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ Show calculation on attached form	☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid?	☐	☒
If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ Show calculation on attached form	☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*?	☐	☒
If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available?	☐	☐ Phase 2 required
If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐	☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling?	☐	☐
If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐	☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☐ Show calculation on attached form	☒ Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Main Hole Drilling Mud Additive List (1494 – 2110 metres)

Product Name	Amount Used	Brief Description of Product
Calcium Carbonate	238 sacks @ 25 kg	Weighting Material
Calcium Chloride Fines	22 sacks @ 40 kg	Weighting Material/Calcium Chloride Fine
Carbomul SEA	4 units @ 55 G	Emulsifier
Carbotec L SEA	3 units @ 55 G	Oil Mud Emulsifier
Carbo TEQ-E Invert	63 m^3	Hydrocarbon, Lubricant
Diesel Fuel	24 m^3	Hydrocarbon, Lubricant
Lime	82 sacks @ 20 kg	Alkalinity pH Control
Mil-Bar	1118 kg @ 40 kg	Barite, Weighting Material
Mil-Clean	1 unit @ 55 G	Surface Active Agent
OilGel 3000	37 sacks @ 22.7 kg	Viscosifier
Sawdust	77 sacks @ 18.1 kg	Lost Circulation Material
SoluFlake Fine	50 sacks @ 22.7 kg	Flaked Calcium Carbonate, LCM
SoluFlake Medium	16 sacks @ 22.7 kg	Flaked Calcium Carbonate, LCM

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

According to the June 1999 Final Well Report, the main hole was drilled using a nitrified calcium chloride invert mud system. There was no information in available documentation reviewed with respect to how or where the main hole drilling waste was disposed of. As a worst case scenario, it is assumed that the drilling waste was disposed of on site.

The drilling waste does not meet the requirements of the Compliance Option 2 checklist and associated calculations and further investigation of a potential on site drilling waste disposal area is required.

Location: Para et al Liard F-36 Re-entry **Spud:** 23-Dec-98

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50* , *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
1118	÷	2110	÷	3	=	0.18	Meets

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Location: Para et al Liard F-36 Re-entry **Spud:** 23-Dec-98

Salt Calculations for Option 2:

Alternative 2

If the volume of drilling waste is not known, use the following calculator to determine the NaOH Equivalent Sacks per metre of well depth. This value must be less than **0.0260** for wells drilled before October 22 1996, or **0.0350** for wells drilled on or after this date. If the value exceeds the target, a Phase 2 ESA (Compliance Option 3) must be conducted.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda		X	1.00	=	0
Soda Ash		X	0.75	=	0
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate		X	0.95	=	0
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)		X	0.22	=	0
Calcium Chloride	35.2	X	0.72	=	25.344
Calcium Nitrate		X	0.34	=	0
Envirofloc		X	0.41	=	0
Gypsum**		X	0.59	=	0
Lime**	42.2	X	1.08	=	45.576
** Max = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns	365.4372985	X	0.68	=	248.497363

Total NaOH Equivalent Sacks	=	319.417363	
Well Depth (m)	÷	2110	**Result**
NaOH Equivalent Sacks per Metre	=	**0.1514**	**Exceeds**

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

= Required Field

Drill Stem Test Return Calculations for Compliance Option Two

Location: Para et al Liard F-36 Re-entry **Spud:** 23-Dec-98

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
84.8	43	0.242733555	x	250000	÷	7600	=	7.98465642
84.8	80	0.451597312	x	250000	÷	7600	=	14.8551747
84.8	1750	9.8786912	x	250000	÷	7600	=	324.956947
84.8	95	0.536271808	x	250000	÷	7600	=	17.64052
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
						Total number of sacks	=	365.437299

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

= Required Field

NWT Phase 2 Environmental Site Assessment

North Shore Environmental Consultants Inc. is pleased to submit our Phase 2 Environmental Site Assessment Report for the F-36 (60° 10', 123° 15') wellsite to Paramount Resources Ltd.

North Shore appreciated the opportunity to work on this project and if we can provide clarification of any part of this report, please call the undersigned at (780) 467-3354.

Yours truly,

North Shore Environmental Consultants Inc.

EXECUTIVE SUMMARY

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the F-36 (60° 10', 123° 15') wellsite (Site) located near Fort Liard, NWT. The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017. Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines. The areas of potential environmental concern included the following:

- Well centre;
- Production facility/former spill areas;
- Flare stack area;
- Potential drilling waste disposal area (DWDA) associated with the well re-entry, including the former sump area on the northwest portion of the site; and
- Drilling flare pit area.

Between February 1, 2017 and February 3, 2017, 37 boreholes were advanced at the Site. Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

1 INTRODUCTION

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the Para et al Liard F-36 (60° 10', 123° 15') wellsite (Site) located near Fort Liard, Northwest Territories (NWT).

1.1 Objective

The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017 (North Shore, 2017).

1.2 Scope of Work

The scope of work for the Phase 2 ESA included the following:

- Review background information to assist with establishing site specific protocols.
- Prepare for ground disturbance activities. The defined work area included the lease and a 30 metre (m) buffer zone around the lease boundary.
- Supervise two sets of private utility locating surrounding the proposed ground disturbance locations.
- Conduct a tailgate safety meeting prior to initiating work each day at the Site. This includes North Shore personnel and contractors.
- Characterize and delineate any suspected impacted areas and advance two control boreholes near the site boundary location in a landscape representative of onsite topography.
- Log soil stratigraphy according to the Canadian System of Soil Classification (CSSC) (Soil Classification Working Group, 1998) with additional comments on potential impacts. Collect samples from each borehole and record organic vapor readings.
- Collect borehole soil samples as required based on field screening results.
- Collect field duplicates for every ten samples submitted for analysis.
- Submit selected soil samples for laboratory analysis to determine concentrations of suspected contaminants and background concentrations for control soil.
- Prepare a Phase 2 ESA report to document the results of the laboratory analysis.

2 BACKGROUND

2.1 Site Description

The Site is located at Unit F, Section 36 Grid Area 60° 10', 123° 15' approximately 40 kilometres (km) southeast of Fort Liard, NWT. Access to the site is from the west. A location map of the Site is included as Figure 1 and a survey plan is included in Appendix A.

2.2 Land Use and Receptors

The lease is situated on Crown land in a mixed-wood forested area. The Site has not been reclaimed, but natural encroachment from the surrounding forest is evident throughout the lease. A satellite image of the quarter section is included as Figure 2. Site photographs are included as Appendix B.

2.3 Site History and Infrastructure

The Para et al Liard F-36 well was drilled over two winter seasons. It was spudded on March 3, 1998 and drilled until March 28, 1998 to a depth of 1494 m. Drilling of the main hole was completed the following winter between December 23, 1998 and February 5, 1999 to a final depth of 2110 m. The well produced sweet natural gas, condensate and produced water between 2000 and 2005 before the site was deactivated by Paramount in April 2008.

Infrastructure identified in association with the site includes the following: wellhead, two pipe racks, radio tower, meter building, two separator skids, methanol tank within a 1 m high steel containment, aboveground storage tank (AST) in secondary containment, flare knockout drum with vent stack, pig launcher, surface piping, risers, fuel tank and other various chemical barrels and tanks. There were no remote sumps identified in association with the wellsite.

A total of four spills were reported on the wellsite between 2001 and 2003 and included a 1000 litre (L) release of condensate and produced water from a storage tank, a 150 L release of condensate water from a storage tank, a 10 L release of methanol water from a riser on the wellsite, and a 12 L release of glycol from a drum or barrel on the site. A NWT spill report also identified an off lease spill along the access road into the F-36 wellsite between January 21 and 23, 2000. It was estimated that 800 L of waste was released on the access road during rig move events and accumulated in two low spots along the road; however the exact locations are not known. There was contradicting information available with respect to the type of material released. One spill report indicated that the spill material may have contained hydrocarbons and had a hydrocarbon odor while another spill report identified the material as drilling fluid. Snow was windrowed to the road center and then cleaned up and taken to the remote drilling waste lined sump at O-35.

2.4 Previous Environmental Work

A Phase 1 ESA was completed by North Shore in March 2017 (North Shore, 2017). Areas of potential of environmental concern that were recommended for investigation included:

- Well centre;
- Production facility/former spill areas;
- Flare stack area;
- Potential drilling waste disposal area (DWDA) associated with the well re-entry, including the former sump area on the northwest portion of the site; and
- Drilling flare pit area.

3 METHODOLOGY

3.1 Safe Work Procedures

North Shore personnel adhered to Paramount Resources policies and procedures to complete the assessment and investigation program. Standard oilfield personal-protective equipment (hard hat, steel-toed boots, safety glasses, and fire retardant coveralls) were worn by all personnel on-site. A calibrated four way gas monitor for H_2S, O2, CO, and organic vapours was also carried by each person participating in the field work. Nitrile gloves were worn when handling soil samples. All personnel onsite were required to possess copies of the applicable safety certification (Ground Disturbance Level 2, H_2S Alive, Transportation of Dangerous Goods, Workplace Hazardous Material Information System, and Standard Level First Aid). North Shore personnel acquired a Paramount Resources Safe Work Permit prior to commencing fieldwork and a tailgate safety meeting was conducted at the beginning of each work day.

Prior to initiating any ground disturbance, a file review was completed and the proposed assessment area was swept by a third party company for the presence of buried facilities.

3.2 Drilling Program

3.2.1 Borehole Drilling

Between February 1 and 3, 2017, 37 boreholes were advanced as part of the drilling program (Figure 3). Boreholes were completed using a tracked-mounted B-57 drilling rig equipped with 15 cm solid-stem. Boreholes were completed to a maximum depth of 10.5 metres below ground level (mbgl), depending on the assessment location and subsurface conditions.

Delineation of potentially impacted areas was based on field screening, visual cues, and professional judgment. Vertical and horizontal delineations were completed to determine the spatial extent of the potentially impacted material. If potentially impacted material was identified during borehole logging, vertical delineation was completed by sampling parameters above the suspected impact zone and to a depth of 1.0 m below the suspected lowest point of contamination. Horizontal delineation was completed by advancing boreholes in 5.0 m horizontal increments in each direction (north, south, east, and west) until clean material, as determined by field screening and professional judgment, was identified. Select delineation samples were collected for laboratory analyses. The GPS location, reference from a fixed point, and rationale of each borehole is included in the borehole logs in Appendix C.

3.3 Soil Sampling

Throughout the sample collection process, North Shore adhered to sampling procedures described in the Canadian Council of Ministers of Environment (CCME) Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites (CCME, 1993). Samples of the recovered soil were visually inspected for evidence of impact such as free product, staining, or discoloration. The outermost layer of the samples was trimmed using a soil tool to avoid cross-contamination. North Shore personnel wore a pair of clean, chemical resistant nitrile gloves for each soil sample collected as an added preventative cross-contamination measure.

Soil vapor concentrations were field screened for volatile hydrocarbon constituents using an RKI Eagle gas detector (RKI Eagle), calibrated with a 400 parts per million (ppm) concentration of hexane gas with the methane elimination switch turned on. Samples selected for vapor screening were placed into plastic bags, sealed, agitated, and allowed to volatilize. Volatile organic compounds (VOCs) that accumulated within the headspace were then measured in ppm or percent of the lower explosive limit (LEL) and recorded on the borehole logs.

Soil samples were also field screened for salinity related parameters by measuring electrical conductivity (EC) using a Spectrum Technologies Inc. Field Scout Soil and Water EC Metre (EC Probe). Prior to sampling, the EC probe was calibrated with a 2.76 dS/m calibration solution. Once the soil on the auger had been trimmed, the EC probe was inserted directly into the soil media in order to obtain an in-situ EC reading. The EC reading was allowed to stabilize for three seconds before being recorded in the field documents.

All soil samples were placed in sealable plastic bags for field screening organic vapors and inorganic analyses. Soil samples for volatile organic analyses included field preservation with methanol and glass jars with Teflon-lined lids for all other organic analyses. Jarred samples were packed tightly to minimize headspace, help prevent the loss of VOCs, and minimize biodegradation. All samples collected were labeled and placed in a cooler with ice or ice packs to maintain a temperature as close to 4°C as possible. Soil samples were transported to an accredited laboratory for analysis. Standard chain of custody protocols were followed during the transport of the samples.

Soil characteristics at each borehole location were described using classification procedures and terminology from The Canadian System of Soil Classification (Soil Classification Working Group, 1998).

3.4 Quality Assurance and Quality Control

3.4.1 Laboratory QA/QC

Soil samples collected during the February 1 to February 3, 2017, sampling event were submitted to AGAT Laboratory (AGAT) in Calgary, Alberta for analysis. The analytical suite was selected based on regulated compounds that are typically found on oil and gas sites.

AGAT is a Standards Council of Canada (SCC), ISO 9000 Series and ISO/IEC 17025 accredited laboratory and Canadian Association of Environmental Analytical Laboratories (CAEAL) accredited laboratory that uses ESRD recognized methods to conduct laboratory analyses. Method blanks, control standards samples, Certified Reference Material (CRM) standards, method spikes, replicates, duplicates, and instrument blanks are routinely analyzed as part of the QA/QC program at the laboratory. AGAT has indicated that analytical data is only released if it passes the laboratory QA/QC procedures. A summary of the QA/QC procedures adopted by AGAT during the analyses of samples for petroleum hydrocarbon concentrations, salinity parameters, and metals concentrations is included in Appendix D.

4 COMPARISON GUIDELINES

4.1 Comparison Guidelines

Selection of the appropriate set of guidelines is based on the texture of the dominant soil type along with current and potential future land use as determined in the assessment. Where both fine and coarse grain strata are present, grain size is determined by the stratum governing horizontal and vertical migration to a receptor. Fourteen soil samples collected from depths ranging from 0.0 to 6.4 mbgl were analyzed for particle size (75 micron sieve). Ten samples were reported to be fine-grained and four samples were reported to be coarse-grained. The areas of concern assessed during the Phase 2 ESA were predominantly located within fine grained soil; therefore, the fine grained soil guidelines were applied.

As per the direction of Paramount, the guidelines for residential/parkland land use were applied to the Site and laboratory values were compared to the following:

- Soil regulated metals, glycol, benzene, toluene, ethylbenzene, and xylenes (BTEX), PHC fractions F1-F4 and polycyclic aromatic hydrocarbons (PAH) results were compared to the Canadian Council of Ministers of the Environment (CCME) - Tier 1 Soil Remediation Guidelines (CCME, 2017).
- Saturated paste boron and methanol results were compared to the AEP Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1 Guidelines; AEP, 2016a).
- Soil EC, Sodium Adsorption Ration (SAR) and pH values were compared to Environmental Guidelines for Contaminated Site Remediation (EGCSR, 2003) Environment Division. Government of the Northwest Territories (EGCSR, 2003).
- Soil EC and SAR values in the DWDA were compared to the ERCB Directive 050 Equivalent Salinity Guidelines (Directive 050 Guidelines; ERCB, 2012) or if control soils exceed these guidelines, to maximum control concentrations (SCAR Guidelines, AENV, 2001).

4.2 Background Control Characterization and Salinity Guidelines

During the Phase 2 ESA, two control boreholes (17C01 and 17C02) were advanced in undisturbed background locations to a maximum depth of 10.5 mbgl. The purpose of the control sampling was to characterize background soil conditions and to determine the generic salt remediation guideline values for the Site.

One topsoil and six subsoil samples were collected from the two control locations and selected samples were submitted for detailed salinity and/or trace metal analyses.

All control EC and SAR results complied with the CCME and EGCSR Guidelines. The onsite values were compared to the same general EC and SAR range. One of the seven control samples reported a pH value of 5.90 that did not meet the EGCSR Guidelines. This is an indication that the soils in the area have naturally occurring low pH values. Two samples reported selenium values of 1.3 mg/kg and 1.2 mg/kg. When the values are rounded to the appropriate number of significant digits, the value meets

the applicable guideline. All of the other control samples met the applicable remediation guidelines. (Tables 2 through 3).

5 RESULTS OF FIELD INVESTIGATION

5.1 Stratigraphy

Based on the boreholes advanced during the drilling program, soil conditions generally consisted of sandy clay fill from the cut and fill construction of the wellsite over a sandy clay to heavy clay parent material.

5.2 Soil Results

Soil results for areas of concern are summarized in Sections 5.2.1 through 5.2.6. The laboratory analyses for soil samples are presented in Tables 1 through 5 along with the applicable comparison guidelines.

5.2.1 Well Centre Area

Five boreholes (17BH01 to 17BH05) were advanced to a maximum depth of 4.5 mbgl to assess and delineate the well centre area. The boreholes were advanced prior to abandonment; therefore the wellhead was still in place. Ground cover in the area was uniform and similar to the surrounding lease. VOC field screening results from the well centre samples were all less than 60 ppm. EC field screening results from well centre samples ranged from 0.04 to 0.81 dS/m.

Four samples (including one duplicate sample) from borehole 17BH01 were submitted for petroleum hydrocarbons, and three samples were submitted for detailed salinity and metal analyses. All of the samples exceeded applicable remediation guidelines for either benzene, ethylbenzene, PHC F2, and/or PHC F3. Additionally one sample exceeded chromium guidelines. All other analyzed parameters complied with the applicable guidelines.

Eight samples collected from the delineation boreholes were analyzed for petroleum hydrocarbons and four samples were analyzed for chromium. One of the samples did not meet the applicable remediation guidelines for PHC F2. All of the remaining delineation samples met the applicable remediation guidelines for hydrocarbons and chromium. Vertical delineation of the impacts and lateral delineation of the chromium were accomplished, however lateral delineation of the hydrocarbon impacts was not achieved as part of the assessment.

5.2.2 Production Facilities Area

Ten boreholes (17BH06, 17BH10 to 17BH18) were advanced within production facility areas. Boreholes were advanced to a maximum depth of 3.0 mbgl. All above and below ground infrastructure was in place at the time of the assessment, which affected the placement of some boreholes. Due to the unknown location of the various spills on the wellsite, soil samples were collected in areas with a high likelihood of being associated with former release areas.

Ten samples were submitted for petroleum hydrocarbon, 12 samples were submitted for metals analysis, ten samples were submitted for detailed salinity analysis and 11 samples were submitted for glycol and/or methanol analysis.

One sample reported a selenium value of 1.2 mg/kg, which exceeds the applicable guideline, however when rounded to the nearest appropriate significant digit, the value meets CCME guidelines. One sample collected within a meter shack area did not meet the applicable remediation guidelines for EC with a value if 2.80 dS/m. The identified exceedance was delineated vertically, but not laterally. Upon review of the chemistry contributing the elevated EC value, it was determined that the EC value is potentially being driven by higher concentrations of sodium, calcium, and sulphate that occur naturally in the parent material. The EC value is not believed to be associated with oil and gas activity, given the chloride concentration of 6 mg/kg and lack of any other guideline exceedance for the petroleum hydrocarbons, metals and detailed salinity parameters analysed in the general production facility area. The exceedance is also at depth, below 1 mbgl, and will be placed even deeper in the soil profile upon reclamation, and is not expected to negatively affect vegetation or equivalent land use capability. All of the other soil samples collected within the former production facility/spill areas met the applicable remediation guidelines or were comparable to background control values.

At the time of the assessment, the location of the former spill area along the access road that was noted in the Phase 1 ESA was unknown and a visual assessment could not be completed due to snow covered ground conditions. The access road will be visually assessed during the growing season for any visual signs of a former spill area. If warranted, soil samples will be collected from any suspect areas at that time.

5.2.3 Flare Area

Six boreholes (17BH19 to 17BH24) were advanced to assess and delineate the flare stack and flare knockout tank area. Thirteen soil samples were submitted for petroleum hydrocarbon analysis, twelve samples were submitted for metals and detailed salinity analysis, and nine samples were submitted for PAH analysis to assess the areas of concern.

Three samples from the flare knockout tank exceeded the applicable remediation guidelines for benzene, toluene, ethylbenzene, PHC F2, and/or naphthalene. One sample from the flare stack did not meet the applicable remediation guidelines for EC with a value of 2.45 dS/m. Upon review of the chemistry contributing the elevated EC value, it was determined that the EC value is potentially being driven by higher concentrations of sodium, calcium, and sulphate that occur naturally in the parent material. The EC value is not believed to be associated with oil and gas activity, given the chloride concentration of < 2 mg/kg and lack of any other guideline exceedance for the petroleum hydrocarbons, metals and detailed salinity parameters analysed in the flare stack area. The exceedance is also at depth, below 1 mbgl, and will be placed even deeper in the soil profile upon reclamation, and is not expected to negatively affect vegetation or equivalent land use capability. All other samples submitted for analysis met the applicable remediation guidelines.

Lateral delineation of the hydrocarbon and PAH impacts associated with the flare knockout tank were accomplished, however vertical delineation was not achieved as part of the assessment. Lateral and

vertical delineation of the elevated EC values associated with the flare stack and lagoon area was not achieved as part of the assessment.

5.2.4 Lagoon Area

One borehole (17BH25) was advanced to assess the lagoon area. Two samples were submitted for petroleum hydrocarbons, and three samples were submitted for metals and detailed salinity. Two samples reported EC values of 2.41 dS/m and 2.36 dS/m. Upon review of the chemistry contributing the elevated EC values, it was determined that the EC values are potentially being driven by higher concentrations of sodium, calcium, and sulphate that occur naturally in the parent material. The EC values are not believed to be associated with oil and gas activity, given the chloride concentrations of < 2 mg/kg and lack of any other guideline exceedance for the petroleum hydrocarbons, metals and detailed salinity parameters analysed in the lagoon area. The exceedance is also at depth, below 1 mbgl, and will be placed even deeper in the soil profile upon reclamation, and is not expected to negatively affect vegetation or equivalent land use capability. All other samples submitted for analysis met the applicable remediation guidelines.

5.2.5 Drilling Waste Disposal Area

No surficial visual indicators (i.e., subsided areas or atypical vegetation) were present during the Phase 2 ESA to suggest the possible location of the DWDA. However, the Phase 1 ESA did note a DWDA northwest of well centre for the first well entry. Field observations identified suspected drilling waste material from 2.5 mbgl to a maximum depth of 3.9 mbgl in four boreholes (17BH26, 17BH27, 17BH32, and 17BH33).

Ten samples collected from the drilling waste mix zone were submitted for petroleum hydrocarbon, detailed salinity and/or metal analyses. Six samples did not meet the applicable remediation guidelines for benzene, toluene, and/or ethylbenzene. Arsenic, EC, SAR, and soil pH exceedances were also identified within the drilling waste mix zone. One sample reported a barium value above the applicable remediation guidelines, but met guidelines for fusion true total barium. All other samples submitted for analysis met the applicable remediation guidelines. Sample 17BH26 2.5-3.0 mbgl, which did not meet the remediation guidelines for arsenic, was re-run for arsenic using new material from the sample bag; the re-run sample still exceeded the remediation guidelines for arsenic with a value of 20.1 mg/kg.

One sample (17BH26 5.2-2.4 mbgl) was collected beneath the drill waste mix zone and was analyzed for petroleum hydrocarbons, metals and detailed salinity parameters. The sample met the applicable remediation guidelines, indicating that vertical delineation of the impacted area has been achieved.

Four delineation boreholes (17BH28, 17BH29, 17BH30, and 17BH31) were advanced to delineate the DWDA. Four samples collected from the boreholes were analyzed for petroleum hydrocarbons, metals and detailed salinity parameters. One sample did not meet the applicable remediation guidelines for arsenic with a value of 14.4 mg/kg. All of the other analyzed samples met the applicable remediation guidelines. With the exception of arsenic, lateral delineation of the DWDA was achieved as part of the assessment.

5.2.6 Potential Drilling Flare Pit Area

Two exploratory boreholes (17BH34 and 17BH35) were drilled in search of a potential drilling flare pit area. No visual impacts or field screening results were encountered in either borehole; therefore, no samples were submitted for laboratory analysis. Based on the location of the access road and the drilling waste disposal area, as well as the cut and fill construction of the wellsite, a drilling flare pit was unlikely to be constructed on the other boundaries of the wellsite and these areas were not investigated as part of the assessment.

5.3 Quality Assurance/Quality Control

Quality assurance and quality control for analytical data was also assessed by comparing analytical results from select samples to duplicate samples obtained from the same sample location. Primary and duplicate samples were compared and the relative percent differences (RPD) were calculated.

RPD criteria has been applied to field duplicates in order to evaluate the precision of the results. If both the original and duplicate sample concentrations are greater than or equal to five times the laboratory detection limit for a given parameter, the RPD should be less than or equal to 40% (water) and 60% (soils) (CCME, 2016). If the results lie outside of the range, they should be considered estimates only. The results of North Shore's QA/QC program are discussed in Section 5.3.1.

5.3.1 North Shore Environmental's QA/QC Program

Five soil sampling QA/QC measurements were conducted by duplicating soil samples 17C01 3.2 – 3.4 mbgl, 17BH01 1.7 – 1.9 mbgl, 17BH10 2.2-2.5 mbgl, 17BH25 1.3-1.5 mbgl and 17BH33 3.0-3.2 mbgl (referred to as Dup A 3.2-3.4 mbgl, Dup B 1.7-1.9 mbgl, Dup C 2.2-2.5 mbgl, Dup E 1.3-1.5 mbgl and Dup F 3.0-3.2 mbgl). Laboratory comparisons reported good reproducibility for all benzene, toluene, ethylbenzene and total xylene (BTEX), petroleum hydrocarbon (PHC) (F1 – F4), particle size, metals, soluble ions, pH, EC and SAR values, with the exception of two parameters. RPD values for Dup B (sulphate) and Dup F (benzene) exceeded the 60% criteria for soils. RPD value calculations and results for the QA/QC measurements are included in Tables 5 through 9.

6 SUMMARY AND CONCLUSIONS

North Shore completed a Phase 2 ESA on the Site between February 1 and 3, 2017. The assessment consisted of an assessment of the well centre, production facility/former spill areas, the flare stack/flare knockout/lagoon area, the DWDA, and potential drilling flare pit areas. A total of 37 boreholes were advanced, including two control locations.

Petroleum hydrocarbon and chromium exceedances were identified within the well centre area as part of the assessment. Petroleum hydrocarbon, arsenic, soil pH, EC and SAR values above the applicable remediation guidelines were identified within the drilling waste disposal area and the flare stack/knockout tank area did not meet the applicable remediation guidelines for petroleum hydrocarbon parameters. Elevated EC values were identified within a production facility area, the flare stack/knockout tank area, and the lagoon area. However, interpretation of the soil chemistry determined that the elevated EC values are likely naturally occurring. All of the remaining analyzed

soil samples met the applicable remediation guidelines or were comparable to background soil conditions.

Due to an unknown location and snow covered ground conditions at the time of the assessment, a former spill area that was identified along the access road was not investigated as part of the assessment. The access road will be visually assessed during the growing season for signs of a former spill and soil samples will be collected if warranted.

Based on field observations and laboratory analysis, further work is required in order for the wellsite to meet the applicable remediation guidelines.

7 DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

8 CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

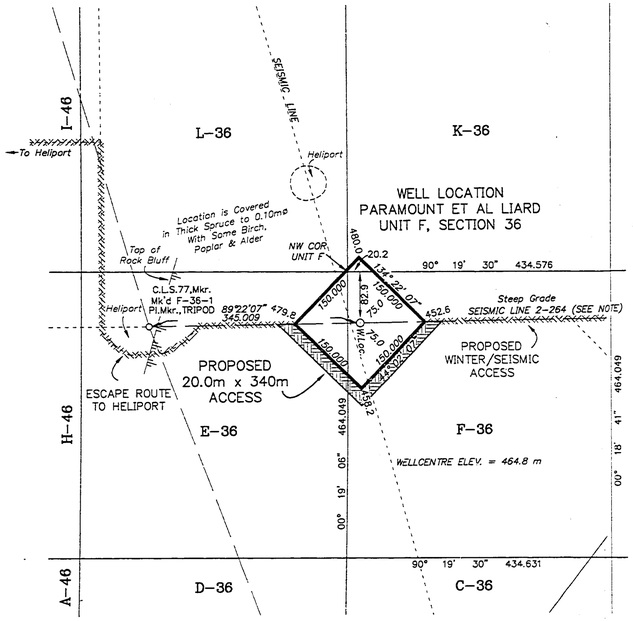
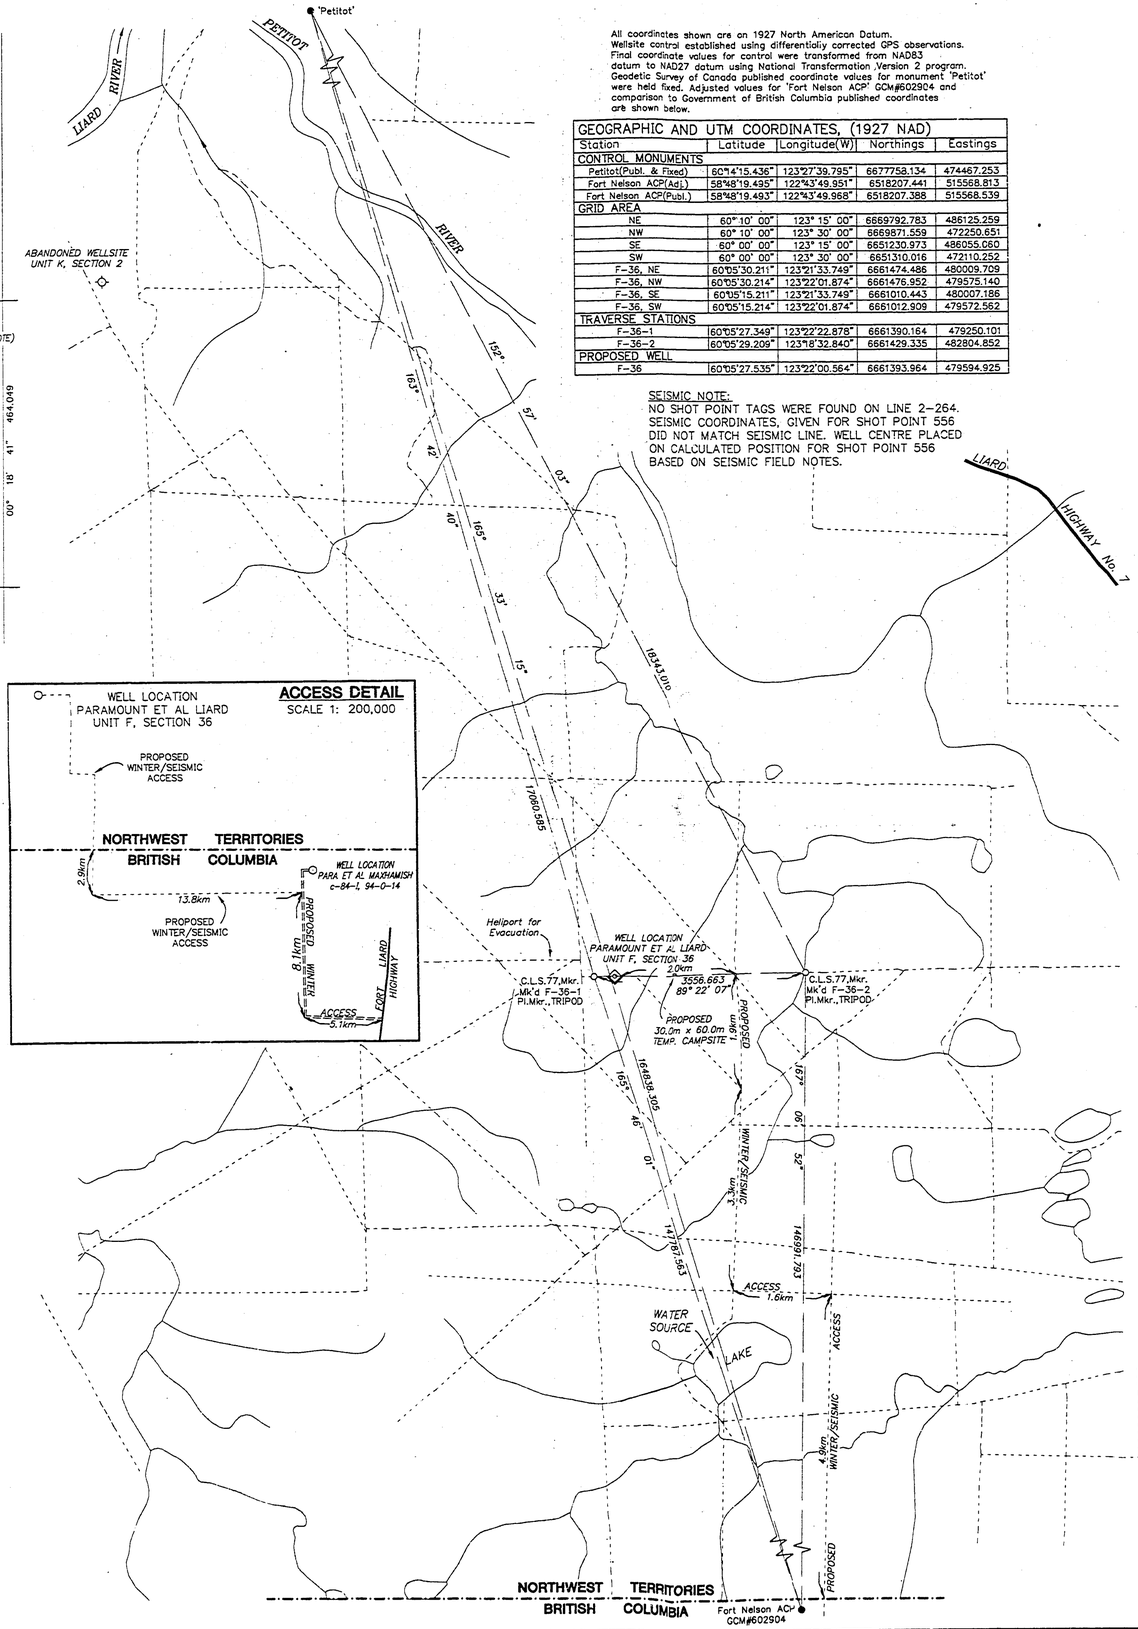
Survey Plan



DETAIL
UNIT F, SECTION 36
SCALE 1:5,000



ACCESS DETAIL
SCALE 1: 200,000

All coordinates shown are on 1927 North American Datum.
Wellsite control established using differentially corrected GPS observations.
Final coordinate values for control were transformed from NAD83 datum to NAD27 datum using National Transformation Version 2 program, Geodetic Survey of Canada published coordinate values for monument 'Petitot' were held fixed. Adjusted values for 'Fort Nelson ACP' GCM#602904 and comparison to Government of British Columbia published coordinates are shown below.

GEOGRAPHIC AND UTM COORDINATES, (1927 NAD)

Station	Latitude	Longitude(W)	Northings	Eastings
CONTROL MONUMENTS				
Petitot(Publ. & Fixed)	60°14'15.436"	123°27'39.795"	6677758.134	474467.253
Fort Nelson ACP(Adj.)	58°48'19.495"	122°43'49.951"	6518207.441	515568.813
Fort Nelson ACP(Publ.)	58°48'19.493"	122°43'49.968"	6518207.388	515568.539

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : W.V. JOHNSON, CLS
NOVEMBER, 1997.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995232.

Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Traverse Hub placed ..... △
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Petitot' Elev. = 218.241 m
Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Sworn before me at Fort St. John, this 23rd day of November, 1997.

THIS SURVEY WAS EXECUTED DURING THE PERIOD
NOVEMBER 14th TO NOVEMBER 17th, 1997. BY W.V. JOHNSON, CLS

PARAMOUNT RESOURCES LTD.

AGAT WORK ORDER: 17C184581

SOIL ANALYSIS REVIEWED BY: Jennifer Liu, Analyst, Qualified Person

TRACE ORGANICS REVIEWED BY: Alison Sekera, Trace Organics Supervisor

DATE REPORTED: Feb 22, 2017

PAGES (INCLUDING COVER): 70

VERSION*: 6

Should you require any information regarding this analysis please contact your client services representative at (403) 735-2005

*NOTES

VERSION 6:Detailed Salinity added to: 295, 312, 315, 316, 321 and 077. Arsenic added to samples: 295, 312, 315, 316, 321 and 077. Extractable Barium added to sample: 033. Glycol added to samples: 544 and 981. Particle size by sieve added to samples: 854, 869, 024, 088, 860, 233, 316 and 077. (Feb 10/17 GH)

Version 2 supersedes version 1 issued on February 10th 2017. BTEX/F1-F4 to samples: 965, 999, 011, 024, 034, 042, 088, 125, 127, 226, 312, 315, 316, 321 and 077. PAH to samples: 996, 997 and 998. Fusion Barium to sample: 033. (Feb 11/17 SS)

Version 3 supersedes version 2 issued on February 11th 2017. Sample: 1032 was re-prepped and re-ran for arsenic and confirmed original value reported. new value was reported under a new sample id: 781 - February 13th 2017 CS.

Version 4 supersedes version 3 issued on February 13th 2017. Monoethylene glycol has been revised to say: ethylene glycol - February 13th 2017 CS.

Version 5 supersedes version 4 issued on February 13th 2017. Added - total chromium to samples: 999, 024, 042, 125, PAH to samples: 984, 226, 1008, 1016, 416, 425 and ethylene glycol to samples: 544 and 981 - February 22nd 2017 CS.

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8170514-8170519 Value reported is amount of sample retained on sieve after wash with water and represents proportion by weight particles larger than indicated sieve size.

8170523 Value reported is amount of sample retained on a 75 micron sieve after wash with water and represents proportion by weight particles larger than indicated sieve size.

8170526-8181077 Value reported is amount of sample retained on sieve after wash with water and represents proportion by weight particles larger than indicated sieve size.

Potassium, Soluble (meq/L)	meq/L		0.05			0.10
Potassium, Soluble (mg/kg)	mg/kg		2			<2
Sodium, Soluble (meq/L)	meq/L		0.09			0.83
Sodium, Soluble (mg/kg)	mg/kg		2			9
Sulfur (as Sulfate), Soluble (meq/L)	meq/L		0.04			4.08
Sulfur (as Sulfate), Soluble (mg/kg)	mg/kg		2			92

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8170543-8171425 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8170514-8171031 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.

8171032-8171033 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.

8171035-8181077 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.

Petroleum Hydrocarbons (BTEX/F1) in Soil

DATE RECEIVED: 2017-02-06

DATE REPORTED: 2017-02-22

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8170997-8171425 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
Total C6 - C10 results are corrected for BTEX.
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
Linearity is within 15%.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8170532-8181077 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
C>10 – C16 (F2- Napthalene) is a calculated parameter. The calculated value is F2 - Napthalene (if requested).
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (if requested).
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
Extraction and holding times were met for this sample.

8170984-8178226 Results are based on the dry weight of the sample.
Based on GC/MS target ion analysis.
Isomers Benzo(b)fluoranthene and Benzo(j)fluoranthene have the same GC retention time and are reported as the sum based on the Benzo(b)fluoranthene response.
B[a]P TPE, IACR (Coarse) and IACR (Fine) are calculated parameters. They are calculated according to the Alberta Tier 1 Soil and Groundwater remediation Guidelines, May 23, 2014. Note that if the analysis returns non-detects for a parameter, ½ the detection limit is entered into the formulas.

Desk Top Remediation Report

PARA ET AL FORT LIARD
300/F-36 60-10-123-15 /00
Fort Liard Field
WID# 1841

Prepared for:
Paramount Resources Ltd

SYNERGYASPEN PROJECT No. PAR6207

July 29, 2021

EXECUTIVE SUMMARY

On behalf of Paramount Resources Limited (Paramount), SynergyAspen Environmental Inc. (SynergyAspen) completed a Desktop Remediation (DTR) review of analytical data for former well site: *Fort Liard F-36* (the Site), with Well Identification (WID) number 1841. The Site is in a remote forested area in the South Liard field, southwest of Fort Liard, Northwest Territories (NT).

The DTR reviewed and assessed data from the 2017 Phase 2 Environmental Site Assessment (ESA) at the Site by North Shore Environmental Consultants (North Shore). Data from the Phase 2 ESA were compared to guidelines provided by the Government of the Northwest Territories in the *Environmental Guidelines for Site Remediation* (Environmental Guidelines), Canadian Council of the Ministers of the Environment (CCME) *Canadian Environmental Soil Quality guidelines* (CESQG), and British Columbia *Contaminated Sites Regulation* (CSR) standards.

The Phase 2 ESA showed five (5) areas of environmental concern (AECs) at the Site: the Well Centre area; the Flare Area; the Production Facilities area; the Lagoon Area; and the drilling waste disposal area (DWDA) (North Shore, 2017b). From the 2017 Phase 2 ESA, the contaminants of concern (COCs) at the surface of the Well Center area were an instance of chromium and Fraction 2 (F2) and Fraction 3 (F3) petroleum hydrocarbons (PHC); and benzene, ethylbenzene, F2 and F3 PHC in the subsurface. The surface of the Production Facilities Area and the Lagoon Area showed elevated electrical conductivity (EC). The Flare Area had exceedances of Benzene and EC in the surface; and benzene, toluene, ethylbenzene, F2 PHC, naphthalene, and EC in the subsurface. The DWDA had subsurface exceedances of benzene, toluene, ethylbenzene, arsenic, pH, EC, and sodium adsorption ratio (SAR) (North Shore 2017b).

Soil stratigraphy at the background boreholes at the Site consisted of silt-loam topsoil overlying clay loam subsoil to 1.2 or 3.0 meters below ground (mbg) followed by firm clay to 4.5mbg, and sandy clay or medium sand to 10.0mbg. Boreholes on the Site were consistent with sandy clay fill from surface to 3.0mbg. A layer of organic material was noted at 1.2-1.4mbg at the Production Facilities Area. In the DWDA, a cap of sandy-clay fill from surface to 2.2 or 2.5mbg, followed by a layer of potential drilling waste to 3.2 or 3.9mbg, followed by hard clay to 6.0mbg, the maximum depth of assessment (North Shore, 2017b).

Based on comparison of the Phase 2 ESA results to the applicable CCME, NT, and BC CSR guidelines, several parameters in the Phase 2 ESA were found to be below applicable guidelines, particularly the Environmental Guidelines. Re-evaluation of the data showed that no risk to receptors at the Site was expected for arsenic, chromium, or salinity (pH, EC, SAR) parameters.

Comparison of benzene, ethylbenzene, and toluene results to the Environmental Guidelines showed the results were below the applicable guidelines for the Site except one sample from the subsurface of the Flare Area was still above the guideline for ethylbenzene.

Results for surface F2 and F3 PHC were compared to the Environmental Guidelines with the potable groundwater pathway removed. All results for F2 and F3 PHC surface samples at the Well Center were above the Environment and Natural Resources (ENR) guideline limit for soil ingestion. Based on the elevated surface concentrations of F2 and F3 PHC, delineation is recommended for the surface of the Well Center area.

Samples from the subsurface at the Well Center area, and one sample from the Flare Area showed F2 PHC above guideline limits. The results were compared to the EG with the groundwater pathway removed, for ecological soil contact; all samples were below the applicable guideline and were not expected to pose a risk to receptors at the Site.

One sample and its duplicate from the subsurface at the Well Center area showed F3 PHC above guideline limits. The results were compared to the EG with the groundwater pathway removed, for ecological soil contact and the duplicate sample was above the applicable guideline. The sample was from >1.7mbg and was below the guideline for soil dermal contact. Therefore, the result was not expected to pose a risk to receptors at the Site.

One sample from the subsurface (>1.7mbg) of the Flare Area had naphthalene above the Environmental Guidelines limits for Residential land use. The result was below the Commercial/Industrial guideline limit, below the guideline for soil and food ingestion, and below a site-specific standard calculated for the Site. Therefore, the sample result was not expected to present a risk to receptors at the Site.

Based on a review of results from the 2017 Stage 2 ESA at the Site, SynergyAspen determined that the naphthalene, arsenic, chromium and salinity exceedances were reasonably expected to pose no risk to receptors at the Site. Rationale for the determination was based on the applicable guideline limits with receptor pathways removed; naturally occurring metals in the soil profile; low regional soil infiltration rates; the lack of associated contaminant impacts; and the depths of the samples. The rationale regarding exceedances were considered to meet the ENR and CCME requirements for determining the risk to receptors at the Site.

Delineation is recommended for surface F2 and F3 PHC concentrations in soil that were above the applicable ENR guideline for Ecological Soil Contact (F2 PHC) and Soil Ingestion (F3 PHC). During delineation, a background borehole to a depth of 6.0 mbg for calculation of hydraulic conductivity is also recommended.

IV. Site-Specific Standard

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen completed a Desktop Remediation™ (DTR) review of historical environmental site assessment information and data for the Paramount former wellsite *PARA ET AL* F-36 - 60-10-123-15, with Well Identification number 1841 (the Site). The Site is in the Fort Liard field of the Northwest Territories.

The scope of work for the DTR involved reviewing and assessing available analytical data to determine the applicability of various guidelines based on land uses and receptors at the Site. Recommendations for remediation at the Site will be provided based on regulatory requirements.

The areas of potential environmental concern (APECs) identified in the 2017 Phase 1 Environmental Site Assessment (ESA) for the Site by North Shore Environmental Limited (North Shore) were the well centre; production facilities and spill area; flare stack area; former drilling waste disposal area (DWDA); and a drilling flare pit/lagoon (North Shore, 2017). The areas of environmental concern (AECs) identified in North Shore's 2017 Phase 2 ESA for the Site were the Well Center, flare stack and flare knockout tank areas for petroleum hydrocarbons, and the DWDA for petroleum hydrocarbons and naphthalene (North Shore 2017b).

2. CURRENT SITE DESCRIPTION

The well was drilled to a depth of 2110 meters in two events, March 3 to 28, 1998, and December 23, 1998 to February 5, 1999. on November 2 and December 4, 1999. The well produced natural gas, condensate, and produced water from 2000 to 2005 and was abandoned in April 2008. The Site was winter-access, in the South Liard field, approximately 17 kilometres (km) southwest of Fort Liard, Northwest Territories (NT). The Site location is presented on Drawing PAR6207-001, in the Drawings Appendix.

The Site was approximately 150m x 150m, with a proposed 30m x 60m campsite east of the Site. Site details and surrounding land uses are shown on Drawing PAR6207-002, in the Drawings Appendix. Table A below summarizes general information regarding the Site's location, topography, hydrogeology, and surrounding land uses.

TABLE A: Summary of General Information

Item	Description
Site Latitude & Longitude	60° 05' 27.12" N; 123° 22' 07.54" W
NTS Map	F-36 - 60°-10'-123°-15'
Well ID #	1841
Land Owner(s)	Crown
Drilling Dates	March 3 to 28, 1998; and December 23, 1998 to February 5, 1999
Total Depth	2110m
Site Description & Size	Site dimensions are approximately 150 m x 150 m square, with a corner oriented to the North, and 20 m x 340 m access from the southwest.
Site Facilities	Wellhead was located at the centre of the Site; 30x60m campsite east of the remote sump area along seismic line
Topography:	
Regional Surface Grade	The regional grade is gently sloping northeast towards a tributary of the Liard River
On Site Drainage	The lease slopes southeast (0-1%) based on the survey details
Surface Cover	In 2017 snow-covered vegetation included willow, spruce, birch, willow, cattail, fescue, brome and dock, which appeared consistent with off-site vegetation
Geology	Bedrock geology consists of Fort Saint John Group, which is comprised of mudstone, siltstone, Shale and fine clastic sedimentary rocks, silty mud, sandstone, coal and conglomerates [BCGS online map resource].
Hydrology & Hydrogeology:	
Nearest Surface Water	Government of NWT ATLAS website shows no water bodies within 500m of the Site. A wetland is visible ~450m southeast of the Site.

Item	Description
Water Wells	Government of NWT ATLAS website shows no water wells within 500m of the Site (Appendix III).
Depth to Groundwater	Unknown
Groundwater Flow	Unknown but likely to the northeast towards the unnamed tributary of the Liard River
Surrounding Land Use (Site)	
North	Mixed wood Boreal forest
East	Mixed wood Boreal Forest
South	Mixed wood Boreal Forest
West	Mixed wood Boreal Forest

3. HISTORICAL REVIEW

The scope of this report included a review of available historical environmental site assessment (ESA) information for the Site. Findings from the review of the available reports are summarized below.

3.1 Phase 1 ESA - 2017

North Shore Environmental Consultants Inc. (North Shore) completed a Phase 1 ESA on the Site, published in March of 2017. The Phase 1 ESA indicated the well produced from 2000 to 2005. Infrastructure at the Site included the wellhead, methanol tank in containment, flare knockout drum with vent; fuel tank and chemical drums; pig launcher and surface piping. A campsite was located east of the Site. Based on Compliance Option #2, the on-site DWDA failed for drilling waste disposal during the final entry of the well, due to salt calculations and unknown disposal of drill stem test returns (North Shore, 2017a).

Five spills were associated with the Site between 2001 and 2003: Cumulatively, 1200L of condensate and produced water, 10L of methanol, and 12L of glycol were released. An assessment in 2004 indicated surface staining at the wellhead and flare stack areas. In 2000, 800L of drilling waste was spilled on the access road, with the location undetermined. In 2013, the berm around the fuel containment showed evidence of a release (North Shore, 2017a). Areas of Potential Environmental Concern noted in the Phase 1 ESA were the well centre; production facility/former spill areas; flare stack area; DWDA on-site and northwest portion of Site; and the drilling flare pit area noted in the well file (North Shore, 2017a).

3.2 Phase 2 ESA - 2017

North Shore completed a Phase 2 ESA on the Site, published in May of 2017. The Phase 2 ESA investigated the APECs identified in the Phase 1 ESA, and consisted of 37 boreholes advanced at the Site. Analytical results from the Phase 2 ESA were compared to the following guidelines: Canadian Council of Ministers of the Environment (CCME) 2017 Tier 1 Soil Remediation Guidelines: the 2003 Northwest Territories Environmental Guidelines for Contaminated Site Remediation; and the 2016 Alberta Tier 1 Soil and Groundwater Remediation Guidelines (North Shore, 2017b). Results showed impacts within the surface and subsurface at the Site: hydrocarbons at the Well centre, Flare area, and DWDA; chromium in one sample from the Well centre; arsenic in 3 samples from the DWDA; pH, electrical conductivity (EC), and sodium adsorption ratio (SAR) in the Lagoon area and DWDA; and polycyclic aromatic hydrocarbon (PAH) naphthalene noted in two samples from the Flare area. Elevated EC noted in the production facility area, the flare stack/knockout tank area, and the lagoon area were attributed to naturally occurring variation in

the soil profile. An historic spill along the access road was not investigated as snow cover prevented identification of the location of the spill. North Shore concluded that further work was required for the Site to meet Alberta remediation guidelines (North Shore, 2017b).

4. SUMMARY OF SITE SOIL CONDITIONS

Based on a review of historical reports, SynergyAspen developed a list of areas of environmental concern (AECs) for the Site. The AECs, along with contaminants of concern (COCs) and associated regulated parameters, are shown on Table B below. The AEC and Site investigation plan are shown in Drawing PAR6207-002, and PAR6207-003.

TABLE B: AECs and associated COCs in Soil*

AEC Label	AECs	Impacted Borehole(s)	COCs (depth)
A	Well centre	17BH01, 17BH02	Benzene, Ethylbenzene, F2 and F3 petroleum hydrocarbon (PHC) (0.8-1.9mbg) Chromium (0.8-1.0mbg)
B	DWDA	17BH26, 17BH32, 17BH31, 17BH33	Benzene, Ethylbenzene, and Toluene (2.2-3.9mbg) Arsenic (2.5-3.4mbg) Barium (3.0-3.9mbg) pH, EC, SAR (2.5-3.2mbg)
C	Flare Area	17BH19, 17BH20	Benzene (0.3-0.5mbg) Benzene, Toluene Ethylbenzene, and F2 PHC (1.7-1.9mbg) Benzene and Ethylbenzene (3.2-3.4mbg) Naphthalene (1.7-1.9 mbg and 3.2-3.4mbg) EC (1.3-1.5 mbg)
D	Lagoon Area	17BH25	EC (1.3-1.5 mbg)
E	Production Facilities Area	17BH16	EC (1.3-1.5 mbg)

*From: North Shore, 2017b.

Soil Stratigraphy

Two background boreholes were assessed at the Site in the North Shore 2017 Phase 2 ESA. Soil stratigraphy at background borehole 17C01 was sandy-clay loam topsoil overlying clay loam to 2.5mbg, overlying hard clay to 4.2mbg, overlying sandy loam and sandy clay to 8.5mbg, and silty clay loam to 10.5mbg, the depth of investigation. Borehole 17C02 showed silty-loam topsoil overlying clay loam to 1.2mbg, overlying clay and hard clay to 4.8mbg, followed by a sand layer to 6.0mbg, the total depth of investigation (North Shore, 2017b).

The stratigraphy at the Well centre area APEC was shown in boreholes 17BH01 through 17BH05. Stratigraphy was similar for all boreholes with firm sandy-clay to 4.5mbg, the maximum depth of assessment.

The stratigraphy at the Flare area APEC was shown in boreholes 17BH19 through 17BH24. Stratigraphy was similar for all boreholes with firm sandy-clay to 4.5mbg, the maximum depth of assessment.

The stratigraphy at the DWDA APEC was shown in boreholes 17BH26 through 17BH33. Stratigraphies in 17BH26, 17BH27, 17BH32 and 17BH33 were similar with sandy-clay to 2.5mbg, overlying a layer of un-mixed drilling waste to 3.9mbg, overlying hard clay to 6.0mbg, the maximum depth of assessment. Boreholes 17BH28, 17BH29, and 17BH30 were similar with sandy-clay to around 3.2mbg, overlying clay or sandy-clay to 4.5mbg. Borehole 17BH31 had hard clay to 3.2mbg, overlying sandy-clay to 4.5mbg (North Shore, 2017b).

Hydrogeology

There were 14 soil samples collected at varying depths from the boreholes across the Site for grain size analysis by sieve pan. The sieve method provides the percentage split between coarse and fine-grained material based on retention on a 75µm mesh screen sieve. The grain size analysis results showed all but four samples were fine-grained, indicating fine-grained material was dominant at the Site (North Shore, 2017b).

The shallow subsurface regional geology of the area north of Maxhamish Lake was reviewed through borehole logs from Phase 2 ESAs completed at four sites in the region. The borehole logs from the following sites were reviewed:

- PARA ET AL MAXHAMISH B- 21-K/094-O-14 (WA#03717) (North shore, 2017c)
- PARA ET AL MAXHAMISH B- 043-K/094-O-14 (WA#12563) (North shore, 2017d)
- PARA ET AL MAXHAMISH B- 083-K/094-O-14 (WA#13773) (North shore, 2017e)
- PARA ET AL MAXHAMISH A-96-J/094-O-14 (WA#13772) (North shore, 2017f)

The sites were located respectively approximately 17 kilometres (km) south-southeast, 15km south-southeast, 11.5km south-southeast, and 13.5km southeast of the O-35 Site. Soil stratigraphy at the b-21-K/94-O-14 site was topsoil and silty-clay overlying clay subsurface. Delineation boreholes around the

site showed clay overlying hard clay, with minor occurrences of sandy loam. Hydraulic conductivity testing was completed at the site from 3 groundwater monitoring wells installed during the Phase 2 ESA: hydraulic conductivity values ranged from $1.0x10^{-9}$ meters per second (m/s) to $2.0x10^{-10}$ m/s, as expected from the soil type at the site (2017c).

The soil profile at background locations at the b-043-K site showed loam surface soil to 0.2m, overlying clay-loam soil to approximately 3.0mbg, followed by silty-clay-loam to 4.5mbg, and silty-loam to 6.0mbg. All samples from various depths submitted for grain-size analysis through sieve analysis showed fine-grained soils dominant in the soil profile at the site (North Shore, 2017d).

The borehole logs from background locations at the b-083-K and A-96-J sites showed consistent profiles with loam surface soil to 0.2mbg, followed by clay to approximately 3.0 mbg, overlying "hard clay" to 6.0mbg, the maximum depth of investigation; a layer of silty-clay was noted in one borehole from the a-069-J site. A sand layer was noted in one borehole from 2.4-2.8 mbg at the b-083-K site. All samples submitted for grain-size analysis through sieve analysis from both sites showed fine-grained soils dominant in the soil profile at the sites (North Shore, 2017e,f). Copies of the reviewed borehole logs and figures are provided in Appendix I and II.

From the Phase 2 ESA for the Site and hydraulic conductivity information the region, there was a sufficient minimum confining layer present between the Site and a deeper regional aquifer. Hydraulic conductivity values of the deeper soils at the Site would be expected to be low due to the hard clay soil at the Site. Therefore, drinking water (DW) standards would not apply at the Site within the shallow soils, but would apply in the deeper aquifer unit, if present. At the time of the assessments there were no water wells, water bodies, or residences within 500m of the Site.

5. ENVIRONMENTAL REGULATORY FRAMEWORK

Numerical soil standards for evaluating the results of the Phase 2 ESA were based on the CCME 2018 Canadian Environmental Soil Quality Guidelines (the CESQ), and the Northwest Territories Environmental Guidelines for Contaminated Site Remediation (the Environmental Guidelines) (Minister of the Environment and Natural Resources [ENR], 2003). The selection of applicable guideline limits in both documents are dependent upon site conditions, applicable receptors at a site, and relevant exposure pathways. From the land use definitions and soil depth considerations in the guideline documents, the Residential/Parkland land use was used to evaluate the 2017 Phase 2 ESA results for the Site.

For assessment of the available data for the F-36 Site, the *Tier 1 – Criteria-based Approach* described in the Environmental Guidelines and the CESQ guidelines were used to determine the applicable hydrocarbon and PAH concentration limits for the Site. Reference to British Columbia's *Contaminated Sites Regulation* (BC CSR) (Ministry of Environment and Climate Change Strategy [MECCS], 2021) is provided for comparison of a site-specific modelling approach described in *Protocol 2 for Contaminated Sites – Site-Specific Numerical Soil Standards (Version 2)* (MECCS, 2017).

For the evaluation of receptors and pathways related to groundwater protection, water use considered proximity to potable water and aquatic receptors, current and potential future use of groundwater aquifers as water sources, and the potential for groundwater extraction based on the hydraulic conductivity of the shallow regional soils.

From the Site information in Section 2, there were no groundwater wells, water bodies, or residences within 500m of the Site. Based on the rationale in Section 4 regarding low hydraulic conductivity due to fine-grained soil in the region, and the lack of water bodies, water wells or residences in proximity to the Site, the Protection of Potable Groundwater, Protection of Freshwater Aquatic Life, and Protection of Livestock Watering pathways would not be operative at the Site.

The following receptor pathways were determined to be applicable at the Site:

For analytical results from soil samples <1.5mbg:	For analytical results from soil samples >1.5mbg:
• Direct Contact; and • Ecological Soil Contact.	• Ecological Soil Contact; • Nutrient and Energy Cycling.

5.1 Guideline Derivation

From the evaluation of receptor pathways at the Site, as described in the ENR guidelines *Tier 1 Criteria-based Approach,* the Protection of Potable Groundwater pathway was not applicable at the Site. Therefore, the guideline limits for F2 and F3 PHC in fine-grained surface soil for Residential land use were determined to be 900 milligrams per kilogram (mg/kg) and 800mg/kg respectively, based on the Ecological Soil Contact pathway. The guideline limits for F2 and F3 PHC in fine-grained subsurface soil (>1.5mbg) for Residential land use were determined to be 2200mg/kg and 3500mg/kg respectively, based on the Ecological Soil Contact pathway. The guideline limit for benzene was 0.5mg/kg; for toluene was 0.8mg/kg; and for ethylbenzene was 1.2 mg/kg (ENR, 2003).

Guideline limits for PAHs at the Site were determined through the CCME 2010 *Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health – Polycyclic Aromatic Hydrocarbons* (CCME, 2010). The CCME 2010 guidelines instruct reference to guidelines in other jurisdictions, in this case, the ENR 2003 guidelines for Residential land use were referenced. The ENR guideline limit at the Site for Naphthalene was determined to be 0.6mg/kg, based on the soil contact pathway (ENR, 2003).

6. COMPARISON OF DATA

Based on the 2017 Phase 2 ESA, soil analytical results were compared to the applicable guideline limits with respect to the operative receptor pathways at the Site. Following Section 4 above, the pathway for potable groundwater at the Site was removed. Table C below shows the historic Site soil data compared to applicable soil guidelines at the Site:

TABLE C: Soil Quality Guidelines for Fine-Grained Surface (<1.5mbg) soil (mg/kg)

Parameter	2017 Analytical Results (North Shore, 2017b)	ENR 2003 Residential/ Parkland	ENR 2003 Residential/ Parkland	ENR 2003 Residential/ Parkland	CCME	
Chromium	145	64	-	-	220 [c]	-
Benzene	0.007	0.5	-	-	-	-
F2	351-5460	900	8000[a]	>30,000[b]	6800[d]	>30,000[e]

*Guideline for Soil Ingestion & Dermal Contact pathway - Ecological Soil Contact pathway removed

As well, further discussion regarding the applicability of various guidelines with respect to expected land uses, available receptors, and site-specific conditions is included in the next section.

7. RESULTS AND CONCLUSIONS

Analytical soil data from the 2017 North Shore Phase 2 ESA were compared to current ENR and CCME guidelines applicable to the Site. A discussion of the results is presented below.

7.1 Soil Results

7.1.1 Arsenic

Three subsurface samples from the DWDA had concentrations of arsenic marginally above the guideline limit. The results from >2.5mbg ranged from 14.4 to 20.1mg/kg, above the CCME guideline of 12mg/kg (North Shore, 2017b). The CCME Residential/Parkland guideline for arsenic in soils was based on protection of human health from soil ingestion with a limit of 12mg/kg, and the protection of environmental health, with a soil contact limit of 19mg/kg (CCME, 1997). The 1991 CCME interim guideline for arsenic was 50mg/kg.

Referring to fact sheets and guidance from the CCME and ENR, a discussion regarding application of guidelines for arsenic with respect to the site-specific conditions follows:

- If a spill or release led to the exceedances for arsenic, contamination from other chemicals, including hydrocarbons, salinity, and metals would be expected. As no residual hydrocarbon, salinity, or metals parameters were indicated in the analytical results for the three samples, it was unlikely that the elevated arsenic concentrations were the result of a spill or release.
- The Site is not currently occupied by humans and is unlikely to be occupied by humans in the future. While the arsenic concentrations in one sample was above the guideline limit for soil contact, the depth of the impacts at >2.5mbg was below the depth that would require mechanical excavation to expose impacted soil for contact or ingestion. Therefore, soil ingestion and soil contact pathways would not be operative at that depth at the Site.
- If removal of the marginal arsenic exceedances in the three samples was undertaken, the heavy equipment used to excavate the soil would likely cause significant impacts to the reclaimed condition at the Site compared to the minimal risk to humans and the environment that may be imposed by the arsenic remaining *in-situ*.

- ENR Guidelines for soil in and around the Yellowknife area noted natural occurrences of arsenic up to 300mg/kg, with the average in and around the Yellowknife area of 150mg/kg (ENR, 2003). The ENR determined a remediation objective of 160mg/kg for Residential land use in Yellowknife area soils, based on accessibility (soil ingestion and soil contact) to the yard for 2 hours per day, 5 months of the year (ENR, 2003). The Site is in a remote setting where access is limited to helicopter transport or winter roads, and toddlers or the public are not expected on a regular basis at the Site. For the Site, access by the public is currently less than 5 months of the year for the CCME maximum concentration of 12.0mg/kg in soil.

In addition, arsenic concentrations in the background/control boreholes show increasing arsenic with increasing depth. Based on the above rationale, the arsenic exceedances detected at the DWDA did not pose a risk to human and ecological receptors at the Site.

7.1.2 Barium

One sample from the subsurface of the DWDA showed a concentration of barium at 1610mg/kg, above the guideline limit of 500mg/kg (North Shore, 2017b). The CCME Residential/Parkland guideline for barium in soil was based on the nutrient and energy cycling for environmental health, with a limit of 500mg/kg.

True total barium which refers to the barium results of using fusion-XRF or fusion-ICP method (AENV, 2009) was measured for the only soil sample with barium exceedance. The guideline for true total barium at Barite Sites for residential/parkland land use is 10,000 mg/kg. Therefore, the barium exceedances detected at DWDA meet the standard and did not pose a risk to human and ecological receptors at the Site.

Besides, barite was used in the mud additive at the Site. Barite contains barium in the form of barium sulphate, a non-soluble and non-toxic form of barium. Northshore requested the analysis of the soil sample for barium concentrations with the calcium chloride ($CaCl_2$) extraction method (MECCS Analytical Method 9). The $CaCl_2$ method is not as aggressive as the Strong Acid Leachable Metals (SALM) method and removes only the more soluble and more toxic barium compounds from the soil. The $CaCl_2$ extraction method is more representative of actual risks to human health and livestock receptors than the SALM method. The resulting barium concentration of 37mg/kg was well below the CCME standard of 500 µg/g.

7.1.3 Chromium

One sample from the surface of the Well Center showed a concentration of chromium (total) at 145mg/kg, above the guideline limit of 60mg/kg (North Shore, 2017b). The exceedance was delineated with the sample below which showed chromium below guidelines. The CCME Residential/Parkland guideline for chromium (total) in soil was based on the nutrient and energy cycling for environmental health, with a limit of 60mg/kg, and the protection of human health from soil ingestion, with a limit of 220mg/kg (CCME, 1997).

Referring to fact sheets and guidance from the CCME and ENR, a discussion regarding application of guidelines for chromium with respect to the site-specific conditions follows:

- The Site is not currently occupied by humans and is unlikely to be occupied by humans in the future. While the Chromium concentration was above the guideline limit for environmental health (nutrient and energy cycling), the result was below the guideline for human health (soil ingestion).
- The depth of the impact at >0.8mbg was below the depth that would require mechanical excavation to expose impacted soil for contact or ingestion. Therefore, soil ingestion and soil contact pathways would not be regularly operative at that depth at the Site.
- If removal of the single chromium exceedance was undertaken, the heavy equipment used to excavate the soil would likely cause significant impacts to the reclaimed condition at the Site compared to the minimal risk to humans and the environment that may be imposed by the chromium remaining *in-situ*.

While the single sample at the Well Center showed chromium above the generic guideline for the Site based on nutrient and energy cycling, the exceedance was below the soil ingestion pathway for human health. Based on the above rationale, the single chromium exceedance detected at Well Center does not pose a risk to human and ecological receptors at the Site.

7.1.4 Benzene, Ethylbenzene, and Toluene

One sample from the surface of the Flare Area, and subsurface samples at the Well Center area, Flare Area, and DWDA had exceedances for benzene: at 0.007mg/kg in the surface and ranging from 0.014-0.372 mg/kg in the subsurface (North Shore, 2017b). The results were compared to the ENR 2003 guideline limits for benzene in fine-grained soil. The guideline limit for benzene was 0.5mg/kg (ENR, 2003); all samples were below the ENR guideline limit, and did not pose a risk to receptors at the Site.

Subsurface samples from the Well Center area, Flare Area, and DWDA showed exceedances for Ethylbenzene, ranging from 0.02 to 2.52 mg/kg (North Shore, 2017b). The results were compared to the ENR 2003 guideline limits for ethylbenzene in fine-grained soil. The guideline limit for ethylbenzene was 1.20mg/kg (ENR, 2003); all samples except one sample from the Flare Area at 1.7-1.9mbg, were below the ENR guideline limit for the Site, and did not pose a risk to receptors at the Site.

One sample from the subsurface of the Flare Area, and two subsurface samples plus one duplicate from the DWDA had exceedances for toluene (North Shore, 2017b). The results were compared to the ENR 2003 guideline limits for toluene in fine-grained soil. The guideline limit for toluene was 0.8mg/kg (ENR, 2003). All samples from the Flare Area and DWDA were below the ENR guideline limit for the Site, and do not pose a risk to receptors.

7.1.5 F2 and F3 PHC

Exceedances for F2 and F3 PHC were noted in the surface at the Well Center, with the highest concentrations <1.0mbg. (North Shore, 2017b). Following Section 4, sample results were compared to the ENR 2003 guidelines for PHC in fine-grained soil, with the protection of potable water pathway removed. All results for F2 and F3 PHC surface samples at the Well Center were above the ENR guideline limit for soil ingestion. Based on the elevated surface concentrations of F2 and F3 PHC, delineation is recommended for the surface of the Well Center area.

Exceedances for F2 PHC were noted in one sample and its duplicate from the subsurface at the Well Center, and in one sample from the subsurface of the Flare Area (North Shore, 2017b). Based on the summary of site conditions in Section 4, the F2 PHC results were compared with the ENR guideline for F2 PHC in fine-grained subsurface soils (>1.5mbg) with the Protection of Groundwater pathway removed, giving a guideline limit of 2200mg/kg for ecological soil contact. All sample results for F2 PHC were below the ENR guideline for ecological soil contact. Therefore, the F2 PHC in the subsurface does not present a risk to human or ecological receptors at the Site.

Exceedances for F3 PHC were noted in one sample and its duplicate from the subsurface at the Well Center (North Shore, 2017b). Based on the summary of site conditions in Section 4, the F3 PHC results were compared with the ENR guideline for F2 PHC in fine-grained subsurface soils (>1.5mbg) with the protection of groundwater pathway removed, giving a guideline limit of 3500mg/kg for ecological soil contact. The sample had a result below the ecological soil contact guideline, however the duplicate sample was above the guideline, with a result of 4500mg/kg. As the sample was collected from >1.7mbg, the result was compared to the ENR guideline with the ecological soil contact pathway removed, giving a guideline for dermal contact of >30,000mg/kg. The depth of the sample was below the depth that would require mechanical excavation to expose impacted soil for dermal contact. All sample results for F3 PHC were below the ENR guideline for dermal contact. Therefore, the F3 PHC in the subsurface does not present a risk to human or ecological receptors at the Site.

Delineation is recommended for surface F2 and F3 PHC concentrations above the Ecological Soil Contact guideline. As well, while the F3 surface concentration was below the residential guideline for Dermal Contact, the concentration in the single sample was above the guideline for the Soil Ingestion pathway.

7.1.6 Naphthalene

Two subsurface samples from the Flare Area showed naphthalene above the guideline limits ranging from 0.014 to 1.04mg/kg. The results were compared to the ENR 2003 guideline limits for naphthalene in fine-grained soil of 0.6mg/kg for Residential land use. For comparison, Commercial/Industrial guideline limit was 22mg/kg (ENR, 2003). One sample, collected from 1.7-1.9mbg was above the ENR guideline for Residential land uses.

7.1.7 Salinity

Four surface samples, from the Production Facilities Area, the Flare Area and Lagoon Area showed EC marginally above the guideline of 2 deciSiemens per meter (dS/m). The increase in EC, with results ranging from 2.36 to 2.80 dS/m, appear to be driven by an increase in calcium sulphate at a depth of 1.3-1.5mbg. Considering the following: the marginal increase in EC; the depth of the exceedances at 1.3mbg, below the rooting zone of most plants; and the presence of naturally occurring calcium sulphate in the soil profile at the Site, the marginal exceedance in EC did not present a risk to receptors at the Site.

Six subsurface samples from the DWDA showed exceedances for pH, EC, and SAR, at depths from 2.5mbg to 3.9mbg. Three samples had pH results above the guideline limit of 8.5. One sample showed EC above the guideline limit of 6.0dS/m. Five samples, including one duplicate, had results for SAR above the guideline limit of 10.0.

Three of the samples were above the CCME guideline limit for pH of 8.5, with results of 9.62, 9.77, and 12.3. The pH exceedances were at a depth of 2.5 to 3.9mbg, below the rooting depth of most plants, and below the depth that would require mechanical equipment for excavation. Therefore, the pH does not present a risk to receptors at the Site.

One sample showed an EC of 7.93dS/m, marginally above the guideline limit of 6.0dS/m for samples >1.0mbg. The increase in EC appears to be related mainly to the large increase in calcium in the sample; a corresponding increase in chloride was noted in the sample. While the increase in EC was driven by the increase in calcium, calcium sulphates were present in the soil profile at the Site, and the exceedance, at 2.5-3.0mbg, was below the depth of most rooting plants. Therefore, the increase in EC in the subsurface at the DWDA does not present a risk to receptors at the Site.

Five subsurface samples, including one duplicate, showed SAR above the guideline limit of 10.0 for the Site. The samples were taken at 2.2-3.9mbg from the DWDA. The increases in SAR appear to be driven by increases in sodium and a lack of magnesium in the samples: sodium ranged from 103 to 502mg/kg in the samples; magnesium ranged from <1.0 to 2.0mg/kg. Chloride in the samples ranged from 11 to 29mg/kg, with chloride of 145 mg/kg in one sample.

The increase in sodium was correlated with an increase in sulphates in the samples. SAR exceedances ranged mainly from 11.7-16.2 in the DWDA; one sample had an SAR of 38.1. The SAR of 38.1 was collected at 3.0-3.9mbg; the sample had minimal calcium of 14.0mg/kg, and no/little magnesium <1.0mg/kg, which skewed the SAR results higher. Based on the depth of the samples at more than 2.2mbg, the lack of magnesium skewing the SAR calculation, and the minimal amount of chloride in the samples, the SAR does not pose a risk to receptors at the Site. SAR does not correlate well with toxicity to receptors, however it can affect water infiltration through the soil profile. A higher SAR correlates well with poorer water infiltration. The depth and limited extent of the elevated SAR will not negatively affect water infiltration at the Site. Surface conditions and vegetative growth have not been affected by the elevated SAR at the Site.

8. CONCLUSIONS

Based on a review of results from the 2017 Stage 2 ESA at the Site, SynergyAspen determined that the PAH, arsenic, chromium and salinity exceedances at the Site were reasonably expected to pose no risk to receptors at the Site. Rationale for the determination was based on the applicable guideline limits with receptor pathways removed; the lack of associated contaminant impacts; low regional soil infiltration rates; naturally occurring metals in the soil profile; and the depths of the samples. The rationale regarding exceedances at the Site were considered to meet the ENR and CCME requirements for determining the risk to receptors at the Site.

Delineation is recommended for surface F2 and F3 PHC concentrations in soil that were above the applicable ENR guideline for Ecological Soil Contact (F2 PHC) and Soil Ingestion (F3 PHC). During delineation, a background borehole to a depth of 6.0 mbg for calculation of hydraulic conductivity is also recommended.

9. CLOSURE

Based on the evaluation of the available historic data, further environmental work is required at the Site prior to submission of the report to the ENR.

Thank you for the opportunity to conduct the work presented herein. If you have any questions or comments, please do not hesitate to contact the undersigned at 250-785-1030.

Respectfully Submitted,

SYNERGYASPEN ENVIRONMENTAL INC.

11. USER RELIANCE AND GENERAL LIMITATIONS

11.1 User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited (the Client). The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

11.2 General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : W.V. JOHNSON, CLS
NOVEMBER, 1997.

I, W.V. Johnson, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

W.V. Johnson, CLS

Sworn before me at Fort St. John, this 23rd day of November, 1997.

THIS SURVEY WAS EXECUTED DURING THE PERIOD
NOVEMBER 14th TO NOVEMBER 17th, 1997. BY W.V. JOHNSON, CLS

PARAMOUNT RESOURCES LTD.

Rev: 17.01.25

Notes:

Land Use: **Residential/Parkland** Grain Size: **Fine**

[1] - Canadian Council of Ministers of the Environment (CCME). 2017. Tier 1 Soil Remediation Guidelines

[2] - Fraction 1 petroleum hydrocarbons (C6-C10) minus benzene, toluene, ethylbenzene and xylene concentrations

[3] - Fraction 4 petroleum hydrocarbons (C34-C50 or >C34) as determined by high temperature gas chromatography

Bold - Value exceeds specified guideline

Bold - Value exceeds specified guideline but comparable to background conditions

Blank - Not analyzed

NC - No criteria established

SYNERGYASPEN PROJECT No. PAR 6206

March 24, 2021

EXECUTIVE SUMMARY

At the request of Paramount Resources Limited (Paramount), SynergyAspen Environmental Inc. (SynergyAspen) completed a Limited Phase I Environmental Site Assessment (Phase I) for former wellsite *Para et al Mount Coty I-02* with unique well identifier 300/I-02 60-20-123-30/1 with well identification number 1884 (the Site). The Site is in a remote forested area, approximately 6 kilometers south of Fort Liard, Northwest Territories (NWT).

The scope of this Limited Phase I included a review of available background and historical information including aerial photographs, NWT government databases, topographic maps, and interviews with persons knowledgeable about the Site. The Phase I was limited due to having no site visit completed, therefore no site photos or evaluation of landscape or vegetation were provided.

Based on SynergyAspen's review of available information, SynergyAspen has identified the following areas of potential concern (APECs):

APEC	Rationale	Source Description	PCOCs
A) Wellhead	The wellbore was located at the centre of the Site.	Drilling Mud, Petroleum Hydrocarbons, Condensate, Metals, Produced Water	Benzene, Toluene, Ethylbenzene, Xylene (BTEX), Fraction 1 to 4 Petroleum Hydrocarbons (F1-F4G); Polycyclic Aromatic Hydrocarbons (PAHs); Metals; Salinity
B) On-site Drilling Waste Disposal Area (DWDA)	Drilling waste disposal failed Compliance Option #2 based on lack of information regarding disposal of recovered DST fluids; and drilling waste failed the Option 2 salinity and barite loading calculations. DWDA was located west-southwest of well center on the Site, per 2004 aerial photo.	Drilling mud, additives, petroleum hydrocarbons, condensate, metals, drill cutting, workover fluids, well treatment chemicals and produced water	BTEX & F1-F4G; PAHs; Metals; Salinity
C) Flare Area	A flare pit was noted in the north of the well centre.	Petroleum Hydrocarbon, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity
D) Flare Stack	A flare stack was noted in the northwest corner of the site.	Petroleum Hydrocarbon, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity

APEC	Rationale	Source Description	PCOCs
E) Above-ground Storage Tank (AST) Area	A 400barrel AST was noted in the northeast corner of the site.	Petroleum Hydrocarbon, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity

The executive summary should be read in conjunction with the entire report for a complete understanding of our rationale, conclusions, and recommendations.

The general limitations of this document are contained in Section 7.

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen Environmental Inc. (SynergyAspen) completed a Limited Phase I Environmental Site Assessment (Phase I) for former wellsite *Paramount et al Mount Coty I-02* with unique well identifier 300/I-02 60-20-123-00/1 with well identification number 1884 (the Site). The Site is in a remote forested area, approximately 6 kilometers south of Fort Liard, Northwest Territories (NWT).

The purpose of the Limited Phase I was to identify:

- Past and present uses on the Site;
- Areas of potential environmental concern (APECs) at the Site; and,
- Potential contaminants of concern (PCOCs) related to the APECs that may have potentially impacted the Site.

The scope of this Limited Phase I included a review of available background and historical information including aerial photographs, NWT government databases, topographic maps, and interviews with persons knowledgeable about the Site. The Phase I was limited due to having no site visit completed, therefore no site photos or evaluation of landscape or vegetation were provided.

This Limited Phase I was completed in general accordance with the requirements established by the Alberta Environment and Parks (AEP) regulations, and the Canadian Standards Association (CSA) Standard Z768-01 (R2006) for Phase I Environmental Site Assessments.

2. SITE AND SURROUNDING PROPERTY DESCRIPTION

The Site was a former wellsite, with current well operation listed as suspended, located on Crown land approximately 7.5 km southwest of Fort Liard. The wellsite was approximately 150 meters (m) x 150m (2.25 hectares [ha]), with a campsite measuring 60m x 40m (0.24ha) located south of the wellsite access road, and a 50m x 75m (0.38ha) decking site on the southeast corner of the Site. The Site is accessed in the winter by an existing seismic line, from an existing winter road, the South Liard Road. The Site and surrounding land are shown on Drawing PAR6206001. The survey and aerial photographs are included in the appendix.

2.1. General Information

Table A summarizes the general information regarding the Site's location, topography, hydrogeology, and surrounding land uses based on a review of available information sources. As a site visit was not included in the scope for this Limited Phase I, current photographs of the Site and surrounding lands were not available.

TABLE A: Summary of On-Site and Off-Site General Information

Item	Description
Site Visit Date	N/A – site visit not conducted
Latitude & Longitude:	60° 11' 34.008" N; 123° 30' 18.78" W
Landowner	Paramount Resources Limited
Legal Description	**UWI 300/I-02 60-20-123-00/0**
WID	**1884**
Primary Land uses	Remote forested and muskeg area
Property Description and Size	Wellsite 150mx150m; campsite 60mx40m; decking 50mx75m
Construction Date	c. 2000
Spud Date	October 16, 2000
Rig Release Date	December 9, 2000
Total Depth	1744 m
Status	Suspended
Abandonment Date	According to OROGO well information, the well will be abandoned in 2021.
Former On-Site Facilities	Wellhead; drilling waste disposal area (DWDA) west of well center; flare pit 50m north of well center
Former Off-Site Facilities	Campsite; decking site
Spills/Surface Conditions	There were no spills reported for the Site (Appendix III).

Item	Description
Topography:	
Site and Regional Surface Grade	Regional grade appears to be to the southwest, towards a ravine ~180m southwest
Hydrology & Hydrogeology:	
Nearest Surface Water	Liard River is located ~2.3km northwest. There is a pond located ~960 m north of the Site.
Water Wells	There were no water wells noted within 500m of the Site (Appendix IV).

2.2 Interviews

An interview with Terence Hughes, Regulatory and Community Affairs Advisor for Paramount, indicated that water well licenses were not issued for the Site. There were no facilities on the Site, and waste storage and disposal were managed at the time of drilling (Hughes, 2021).

2.3 Aerial Photograph Information

Available aerial photographs for the Site and surrounding area were obtained. Copies of the aerial photographs and review notes are included in Appendix I.

2.2 Paramount Well File Information

Well file information for the Site included applications and permits, drilling information including the well report and drilling fluid lists, inspection reports, geological information, and correspondence. Well file information is provided in Appendix V.

In 1999, the I-02 well was proposed for drilling using an invert-based drilling fluid system, however that was changed in 2000 to drilling with a gel-chemical drilling fluid system. The drilling waste was mix-bury-covered on-site, west of well center, and a flare pit was noted approximately 50m north of well center, as seen in the 2005 inspection report photos for the Site. Seven drill stem tests (DSTs) were conducted for the well. Notes for disposal of recovered fluids indicated using the flare pit during testing.

The well was re-completed in 2001 to abandon the Mattson formation, and perforate the Fantasque formation. The operation was permitted to flare 750 thousand m^3 of sweet gas in total.

2.3 NWT OROGO Site Registry Information

The NWT Office of the Regulator of Oil and Gas Operations (OROGO) Site registry was searched for information regarding the Site. Information included the final well report, with general drilling information, drill stem testing reports, and site inspection information. The scanned drilling tour reports in the file were mostly illegible, and drilling additive amounts were taken from invoices in the Paramount well file.

A site plan showed a flare stack in the northwest corner of the Site, and a 400-barrel aboveground storage tank (AST) in the northeast corner of the Site. OROGO file information is provided in Appendix VI.

2.4 Previous Environmental Assessments and Reports

There were no previous environmental assessments or reports available for review for the Site. Site inspection reports in the well file showed the drilling waste disposal area west of well center, holding water. The DWDA is visible in the aerial photographs for the Site. Also, from the inspection photos, the flare pit is visible north of well center approximately 50m, at the edge of the pad.

3. ALBERTA DRILLING WASTE DISPOSAL CHECKLIST

The I-02 well was drilled with gel-chemical drilling fluid, a flocculated water system. Gel-chemical (Mil-gel slurry) fluid was used from surface to 500m depth; a flocculated water system (gypsum/calcium nitrate/Mil-SOS) from 500m to the Garbutt formation; and a gel-chemical system (Mil-gel/Chemical system) to the total depth of 1744m.

A DWDA sampling report was provided in the well file for the Site. However, the Disposal Notification form in the report was for site d-24-G/94-P-05, a site in the Maxhamish Lake area of northeastern British Columbia. The disposal report information therefore did not apply to the Site (Alpine Environmental Ltd., 2001). A site sketch in the DWDA sampling report reflected aerial information for the Site, and showed the DWDA west-southwest of well center, and the flare pit north of well center, along the bermed boundary.

Seven drill stem tests (DSTs) were conducted for the well. Information in the well file indicated flaring to the flare pit. The report from DST #3 indicated disposal of recovered DST fluids into the flare pit area north of well center. The recovery from the DSTs were the following:

- DST #1: 180m “slightly oil-stained” gasified drilling fluid
- DST #2: no recovery
- DST #3:102m of gasified drilling fluid, no salinity
- DST #4: 710m of “mostly fresh” water, 2000ppm salinity
- DST #5: 56m of drilling mud and fresh water
- DST #6: 190m fresh water
- DST #7: 75m fresh water

Compliance Option #2 was used to assess the drilling waste for the well. Drilling tour reports in the Orogo file were mostly illegible, and invoices in the Paramount well file were used for the drilling fluid additive amounts. A Phase II ESA is required for the DWDA on the Site due to drilling waste failing the barite and salt-loading calculations, and lack of information regarding drill stem test returns disposal. Assessment of the flare pit/area north of well center is recommended at the same time. Well information and notes are provided in Appendix II.

4. CONCLUSIONS AND RECOMMENDATIONS

Based on SynergyAspen's review of available documentation, a Phase II ESA is required for the Site. The following APECs and associated PCOCs require assessment:

APEC	Rationale	Source Description	PCOCs
A) Wellhead	The wellbore was located at the centre of the Site.	Drilling Mud, Petroleum Hydrocarbons, Condensate, Metals, Produced Water	Benzene, Toluene, Ethylbenzene, Xylene (BTEX), Fraction 1 to 4 Petroleum Hydrocarbons (F1-F4G); Polycyclic Aromatic Hydrocarbons (PAHs); Metals; Salinity
B) On-site Drilling Waste Disposal Area (DWDA)	Drilling waste disposal failed Compliance Option #2 based on lack of information regarding disposal of recovered DST fluids; and drilling waste failed the Option 2 salinity and barite loading calculations. DWDA was located west-southwest of well center on the Site, per 2004 aerial photo.	Drilling mud, additives, petroleum hydrocarbons, condensate, metals, drill cutting, workover fluids, well treatment chemicals and produced water	BTEX & F1-F4G; PAHs; Metals; Salinity
C) Flare Area	A flare pit was noted north of the well centre.	Petroleum Hydrocarbons, Condensate, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity
D) Flare Stack	A flare stack was noted in the northwest corner of the site.	Petroleum Hydrocarbon, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity
E) Above-ground Storage Tank (AST) Area	A 400-barrel AST was noted in the northeast corner of the site.	Petroleum Hydrocarbon, Metals, Produced Water	BTEX & F1-F4G; PAHs; Metals; Salinity

5. PROFESSIONAL STATEMENT

The above work was completed in accordance with Alberta Environmental Site Assessment and CSA Phase I ESA standards. SynergyAspen certifies that those who produced this report have demonstrable experience and knowledge to complete the scope of work, as described, at this Site.

Respectfully Submitted,

SynergyAspen Environmental Inc.

Azadeh Khojasteh, M.Sc., M.Eng., P.Ag.

7. USER RELIANCE AND GENERAL LIMITATIONS

7.1. User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited, hereafter referred to as the Client. The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

7.2. General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995511. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic Survey of Canada Monument 'Fort Liard' Elev. = 216.299m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

"Certified Correct and completed on the 03rd day of July, 1999.

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information: Unique Identifier (UI) 300/ I-02 60-20-123-30
Spud Date October 16, 2000
Well Depth 1744 m

1.1 Disposal Method (if known)*: Mix-Bury-cover

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: On-site west-southwest of well center

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.

For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☐	☒
If yes, were the disposal areas separate from one another?	☐ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☐ ☐ ☐ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☒ ☐ ☒ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☒ ☐	☐ ☐ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☒	☐ Phase 2 required ☐ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☒	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☐ Show calculation on attached form	☐ ☒ Phase 2 required
3.3 Was zinc carbonate added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ ☐ Show calculation on attached form	☒ ☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*? If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available? If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐ ☐ ☐	☒ ☐ Phase 2 required ☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling? If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐ ☐	☒ ☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☐ Show calculation on attached form	☒ Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Mud Additives (Attach additional pages if necessary.)

Product Name	Amount Used (25kg sacks)	Brief Description of Product
Bicarb soda	3.6	NaCHO3; pH control/Ca remover
BioLose DFE 117	4.5	**Non-fermenting chemically modified starch; filrate reducers**
Caustic Soda	21	NaOH; pH control
Desco	1.5	Chrome base dispersible xantham gum; viscosifier
Ecco Bar Canadian	1175	Assuming this is Barite, added to the barite calculation
Mil-Bar	290	Barite; weighting materials
Mil-Gel	519	Wyoming bentonite; viscosifier
Mil-Gel NT	699	Untreated Wyoming bentonite; viscosifier
Ligco	30	Lignite; thinner/dispersant
Poly Flake	1.5	Polyethylcellulose flakes; lost circulation material
Staflo	16	Polyanionic cellulose; filtrate reducer
Soda Ash	48	Sodium carbonate; calcium remover
Sawdust	71	Sawdust; lost circulation material

Reference Documents (List all source documents used in the completion of this checklist. Attach additional pages if necessary. Documents must be supplied to the AER if requested.)

Petroleum Services Association of Canada – mud list
Environmental Drilling and Completion Fluids Directory
Paramount I-02 hard copy well files
OROGO well file information

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

Compliance Option 2 was used to assess drilling waste disposal for the well.

Daily Mud Records were not available, just a tally sheet in the Final Well report. Mud report was provided without detail information and the days.

Waste disposal failed barite calculation.Seven Drill Stem Tests were conducted, returns included low-salinity salt water, gassified mud, and fresh water. There was no information regarding disposal or treatment of drilling waste or DST fluids. Therefore, a Phase 2 ESA is required for the drilling waste disposal area.

A Phase 2 ESA is required for the drilling waste disposal area due to:

-- drilling waste failed the Barite loading calculations for 3:1 mix-bury-cover;
-- drilling waste failed the salt loading calculations; and
-- no record of proper disposal of drill stem test fluids.

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50* , *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
1465	÷	1744	÷	3	=	**0.28000765**	**FAIL**

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Zinc Carbonate:

Alternative 1:

If waste zinc, mix ratio and waste dry bulk density data are available use the following calculator to estimate post-disposal zinc concentration.

Directions: Enter the total zinc concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m^3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the post-diposal zinc concentration. This value must be less than or equal to **200 mg/kg**. If the value exceeds this objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Waste Zinc Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio**						Post-Disposal Zn Concentration (mg/kg)
	x		÷		÷	1500	+	70	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of zinc carbonate added per meter drilled.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.00650**. If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre
	÷		÷		=	#DIV/0!

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
1.5	÷	1744	÷	3	=	0.000286697	**PASS**

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Salt Calculations for Option 2:

Alternative 1

If the volume of drilling waste is known, use the following calculator to determine the NaOH Equivalent Sacks per m^3 of waste. If this value is greater than **0.10**, a Phase 2 ESA (Compliance Option 3) is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Waste Volume in cubic metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of Sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda		X	1.00	=	0
Soda Ash		X	0.75	=	0
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate		X	0.95	=	0
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)		X	0.22	=	0
Calcium Chloride		X	0.72	=	0
Calcium Nitrate		X	0.34	=	0
Envirofloc		X	0.41	=	0
Gypsum**		X	0.59	=	0
Lime**		X	1.08	=	0
** Maximum number of sacks = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns		X	0.68	=	0

Total NaOH Equivalent Sacks	=	0
Waste Volume (m^3)	÷	
NaOH Equivalent Sacks per m^3	=	**#DIV/0!**

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Gypsum and lime must be calculated separately. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

= Required Field

Alternative 2

If the volume of drilling waste is not known, use the following calculator to determine the NaOH Equivalent Sacks per metre of well depth. This value must be less than **0.0260** for wells drilled before October 22 1996, or **0.0350** for wells drilled on or after this date. If the value exceeds the target, a Phase 2 ESA (Compliance Option 3) must be conducted.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda	21	X	1.00	=	21
Soda Ash	48	X	0.75	=	36
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate	3.6	X	0.95	=	3.42
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)		X	0.22	=	0
Calcium Chloride		X	0.72	=	0
Calcium Nitrate		X	0.34	=	0
Envirofloc		X	0.41	=	0
Gypsum**		X	0.59	=	0
Lime**		X	1.08	=	0
** Max = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns	1.91	X	0.68	=	1.2988

Total NaOH Equivalent Sacks	=	61.7188
Well Depth (m)	÷	1744
NaOH Equivalent Sacks per Metre	=	**0.03538922** **FAIL**

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

= Required Field

Drill Stem Test Return Calculations for Compliance Option Two

Salinity:

Note: Either the resistivity or the chloride calculation must be completed. It is not necessary to complete both calculations. Resistivity data should be used when available. If resistivity is not available, the chloride calculation should be used. If the volume is specified but neither chloride nor resistivity is available, use the default concentration in the chloride calculation. If no volume is available, a Phase 2 (Compliance Option 3) is required.

Alternative 1: Resistivity

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the resistivity of the DST fluid in ohms. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)				Resistivity (Ohms)*		Number of Sacks
		0	x	0.28	÷		=	#DIV/0!
		0	x	0.28	÷		=	#DIV/0!
		0	x	0.28	÷		=	#DIV/0!
		0	x	0.28	÷		=	#DIV/0!
		0	x	0.28	÷		=	#DIV/0!
		0	x	0.28	÷		=	#DIV/0!
						Total number of sacks	=	0

* Resistivity values from formation water databases or adjacent wells are currently not acceptable.

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
114	710	7.2433206	x	2000	÷	7600	=	1.906137
0		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
						Total number of sacks	=	1.906137

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

= Required Field

Hydrocarbons

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return in metres, the percent oil content of the DST fluid, the well depth in metres and the mix ratio. The spreadsheet will calculate the post disposal oil concentration If this value is greater than **0.10%** (dry weight) in subsoil or **0.50%** (dry weight) in topsoil, a Phase 2 ESA (Compliance Option 3) is required.

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)		Oil Content (%)*		Vol. of Oil (m^3 x 100)
114	180	1.8363348	**x**	100.00%	**=**	183.63348
		0	**x**		**=**	0
		0	**x**		**=**	0
		0	**x**		**=**	0
		0	**x**		**=**	0
		0	**x**		**=**	0
				Total Volume of Oil	**=**	183.63348
					÷	0.6
				Well Depth (m)	÷	1744
				Mix Ratio**	÷	3
				Post-Disposal Oil Concentration (%)	=	0.0584969

* Actual measured oil concentration must be used if available. If only visual descriptions are available then use the following to estimate oil concentration:

Flecked = 5%

Emulsion = 25%

Oil or oil-cut mud= 100%

Do not include gas-cut mud or mud with no indication of oil.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Attention: Terence Hughes

File Number	**MV2016A0010**
Type of Operation	**OIL AND GAS DRILLING - WELLSITE**
Location	Well Sites: F-36, I-02, I-46, N-01 and O-35.

Dear Terence Hughes,

An inspection of the above noted operation was conducted on August 10, 2017 by Resource Management Officer II Kyle Christiansen and Manager, Resource Management Jarret Hardisty.

Enclosed is a copy of the Environmental Inspection Report.

If you have any questions, please contact me at 867-695-2626 ext.206.

Sincerely,

Kyle Christiansen
Resource Management Officer II

Explanatory Remarks -

Well Sites:

Inspectors from the Department of Lands inspected the well sites and access roads which were utilized during the last winter season. All well sites under MV2016A0010 except A-01 were inspected during the flight on August 10, 2017. The winter access roads that were used during the winter showed no signs of rutting or erosion.

The F-36 well site still had the wellhead and a pipeline riser on site at the time of inspection. Water was pooling on one side of the lease and a pile of soil and debris was located between the riser and the wellhead. Vegetation covered approximately 60% of the well site while the bare soil locations looked to be used by Bison. Inspectors have no concerns with the F-36 well site and will continue to monitor the location.

The I-02 well site also had the wellhead still on site. Vegetation was covering approximately 95% of the well site. Inspectors noted water pooling in what appeared to be old sumps. The old sumps had vegetation established within. Inspectors have no concerns with the I-02 well site and will continue to monitor the site.

The I-46 well site had the wellhead and all above ground facilities removed off the site. Vegetation covered approximately 70% of the well site with woody vegetation encroaching

ENVIRONMENTAL INSPECTION REPORT

from the surrounding forest. Inspectors have no concerns with the I-46 well site and will continue to monitor the location.

The N-01 well site had the wellhead removed during the last winter season. Inspectors noted several locations of pooling water which appeared to be old sumps. Some lumber and a rig mat were also noted being on the well site during the inspection. Inspectors have no concerns with the N-01 well site and will continue to monitor the location.

The O-35 well site also had the wellhead removed during the last winter season and all above ground facilities removed. A small pile of soil with debris was located near the former wellhead location. Vegetation covered approximately 80% of the well site. Inspectors have no concerns with the O-35 well site and will continue to monitor the location.

February 1, 2001

Attention: Mr. Terry Baker, Chief Conservation Officer

Dear Sir,

Re: Para et al Mount Coty I-02
WID: 1884
UWI: 300I026020123300

Paramount Resources Ltd. submitts the attached **Approval To Alter Condition Of A Well** with the Recompletion Program on the referenced well. The completion program previously approved on December 06, 2000 was a continuation of the drilling program to evaluate the upper Mattson formation.

As the upper Mattson was found to be non-productive, the Recompletion Program being submitted is to continue operations by abandoning the upper Mattson and completing the well in the Fantasque to evaluate for hydrocarbon potential.The maximum anticipated gas flow rate is estimated to be 71.5 x 10^3m^3 per day for a period of 10 days. The total estimated sweet gas test volume is 750 x 10^3m^3. The gas in the Fantasque is sweet.

The Drive Well Servicing Rig #642 will be used to perform this work. This rig was previously approved by the NEB for performing work in the NWT for completing Para et al Fort Liard I-46.

The operations programmed will be performed in conjunction with the previously submitted Emergency Response Plan.

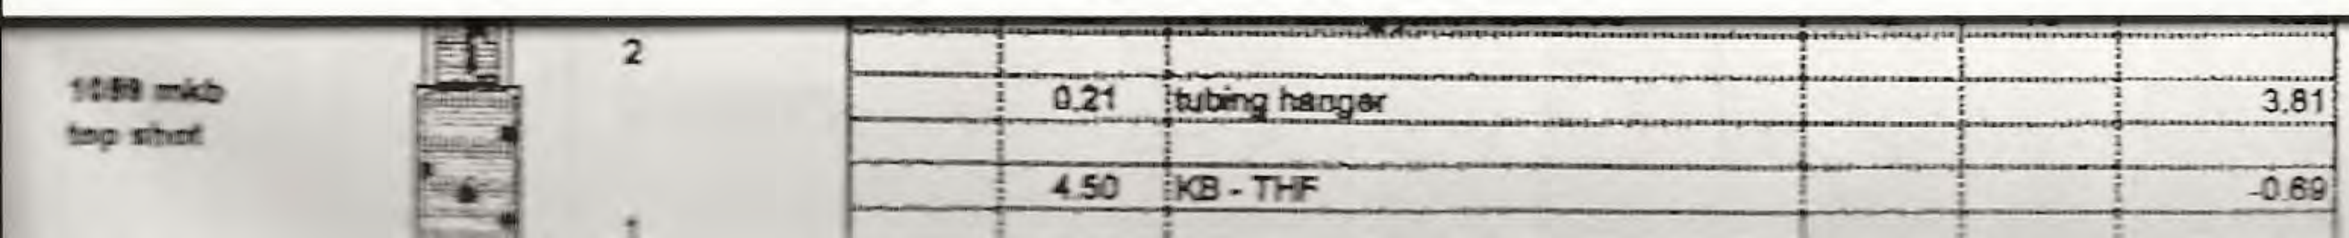
All efforts in expediting the approval for this application will be appreciated.

Please contact Wayne Tomm at 290-3626 if you require additional information. Thank you for your assistance.

Yours truly,

PARAMOUNT RESOURCES LTD.

Wayne Tomm, P. Eng.
Sr. Drilling and Completions Engineer



RECOMPLETION PROGRAM

PARA ET AL MOUNT COTY I-02

AREA 60^0 20' 123^0 30'

AFE NUMBER:	**00N120034**
WID:	**1884**
UWI:	**300I026020123300**
File:	**9211-P33-12-6**

Prepared By: Wayne Tomm

	4.50	KB - THF			-0.69

A. WELL INFORMATION SUMMARY

See attached Well Information sheets. The purpose of this program is to abandon the Mattson formation perfs at 1059m – 1067mKB with a bridge plug and cement, perforate the Fantasque 897m – 917mKB and evaluate for hydrocarbon potential in this area.

Note: The well is to be completed with the service rig – Drive Well Services Rig #642.

RE-COMPLETION PROFILE:

1) Move in service rig and associated equipment.
2) Kill well with water.
3) Nipple down wellhead and install BOP stack.
4) Pressure test casing and BOP stack.
5) Unseat packer and pull out of hole laying down packer assembly.
6) Run in on wireline and set bridge plug at 1045m.
7) Dump bail 8m cement on top of BP and pressure test..
8) Perforate with TCP and flow test the Fantasque Formation
9) Perform a frac if required and re test.
10) Release service rig.

SAFETY

REFER TO THE SITE SPECIFIC "EMERGENCY RESPONSE PLAN"

All operations are to be carried out in accordance with government regulations and recognized safety procedures. Operations are to be conducted in a manner that results in the greatest degree of protection possible for the public, on-site personnel and the environment.

Service Rig Manager and Wellsite Supervisor are to have valid PITS "Well Service Blowout Prevention" and "H2S alert" certificate on site.

THIS WELL IS NOT EXPECTED TO ENCOUNTER H_2S.

Continually monitor annulus pressures and bleed off if necessary.

Exploratory ☒ Development ☐ | Delineation ☐ Service ☐

APPROVAL TO DRILL A WELL

This application is submitted under Section 82 of the Canada Oil and Gas Drilling Regulations. When approved under Section 83 of the Regulations, it is the requisite approval for the commencement of drilling operations.

Well Name: Para et al Mount Coty I-02

Operator: Paramount Resources Ltd.

Contractor: Precision Drilling

Drilling Rig or Unit: 379

Drilling Program No.:

Interest Identifier: EL 381

Estimated Well Cost: $2,750,000.00

Location-Unit: I Section: 02 Grid Area: 60° 20', 123° 30'

Coordinates: Lat.: 60° 11' 34.008" Long.: 123° 30" 18.797"

Area: Fort Liard, NWT Field/Pool: N/A

Elevation-KB/RT: 374.6 m (ASL) GL/Seafloor: 369.1 m

Approx. Spud Date: August 31, 2000 Est. Days on Location: 35

Anticipated Total Depth: 1746 Target Horizons: Chinkeh, Mattson

EVALUATION PROGRAM

Ten-metre sample intervals

Five-metre sample intervals Surface to total depth.

Canned sample intervals Surface to total depth.

Conventional cores at 8m core in Mattson.

Logs and Tests HDIL/GR, MAC/GR/CAL, ZEL/ CNL/GR/ PE/XY CAL, EMT
1 DST in Frantasque, 2 DST's in Mattson

CASING AND CEMENTING PROGRAM

O.D. (mm)	Weight (kg/m)	Grade	Setting Depth (m KB)	Cementing Program (m^3)
244.5	53.57	J-55	500	21.83m^3 0:1:0 "G"
177.8	38.69	J-55	1746	24.35m^3 0:1:0 "G"

B.O.P. Equipment: 21 mPa Class IV Stack and Manifold with one (1) Flow Diverter, one (1) annular preventer, three rams (1 double gate, and 1 single gate) and double choke manifold.

Other Information: This well was originally approved December 13, 1999 with WID 1884 and UWI 300I02 60 20 12330. Due to constraints the well was not drilled at this time, and is planned to spud August 31, 2000. The two changes to the program are; (a) the 177.8mm csg. will be run to total depth and (b) the well will be drilled with gel-chem mud system only.

Attention: Rod Armstrong

Dear Mr. Armstrong

"LIARD" I-02

Please find enclosed the original drilling waste sampling report, notification of drilling waste disposal and lab analysis for work completed at the above mentioned location on December 12, 2000.

The notification of drilling waste disposal was submitted to the Department of Indian Affairs and Northern Development on your behalf, on December 14, 2000. Approximately 1400 m^3 of Pit A solids are satisfactory for disposal under mix/bury/cover criteria.

I trust the above meets with your approval. Should you have any comments or concerns, please contact our Grande Prairie office (780-538-0050) at your earliest convenience. As no additional work is required at this location, it is our intent to close this file.

Yours truly,

ALPINE ENVIRONMENTAL LTD.

DRILLING WASTE SAMPLING REPORT

Prepared for
Nahendeh Land & Environmental Services , LLP

Re: Paramount Resources Ltd.
"LIARD" I-02

Project No. N0007

December 12, 2000

ALPINE ENVIRONMENTAL LTD.

Your Natural Resource for Environmental Services

DRILLING WASTE SAMPLING REPORT

PROJECT NO: N0007 **TICKET NO:** N1005 **DATE:** December 12, 2000

COMPANY NAME: Paramount Resources Ltd.
LEGAL DESCRIPTION: "LIARD" I-02
LOCATION OF SUMP: On-site
CONDITION OF ACCESS: Low-grade (winter access)
SAMPLED BY (Individuals): Ryan Hennessey & Dean Sahara

	PIT A		
OIL COVER (%)	100% light sheen		
FREEBOARD (m)	1.3		
TOTAL VOLUME OF SUMP (m^3)	1400		
TREATABLE FLUID VOLUME (m^3)	0		
SOLIDS VOLUME (m^3)	623		
CUTTINGS VOLUME (m^3)	N/A		
ICE VOLUME (m^3)	777		

DESCRIPTION OF FLUID

At the time of sampling, there was no fluid present in Pit A.

COMMENTS

The on-site soil texture consists of sandy clay. Pit A was excavated with a hoe.

The northeast corner of the sump is located 3 m north and 6 m west of the well centre. A rig move was in progress at the time of sampling.

LOCATION ACCESS MAP

PROJECT NO: N0007 **TICKET NO:** N1005 **DATE:** December 12, 2000

South-west corner	0 m South	0 m West				

COMMENTS
Approximately 1400 m3 of Pit A Solids are satisfactory for disposal under mix/bury/cover criteria in the G-50 guidelines. A minimum mixing ratio of 1 part waste to 3 parts soil will ensure all parameters are within G-50 guidelines.

As a mud list was not available at the time of sampling a microtox was completed to ensure no toxicity problems with the sampled waste.

Additional comments, disposal/treatment plan details, or site maps may be added on a separate page.

GEOLOGICAL PROGRAM AND PROGNOSIS

(Preliminary Geological Program and Prognosis) **July 6, 2000**

1. General Well Info:

Well Name: **Paramount et al Liard NWT I-02-60-20-123-30**

Location: **60 degrees 11 minutes 34.008 sec N / 123 degrees 30 minutes 18.797 sec W**
Seismic line: 2-268; 129 m N of SP 500

UWI: **I-02-60-20-123-30**

Classification: Exploratory well

Primary Target: **Mississippian Mattson Sandstone** – sweet gas with minor condensate or oil

Secondary Target(s): **Basal Cretaceous Chinkeh Sandstone** – sweet gas with minor condensate
Permian Fantasque – sweet gas
Mississippian Flett – sweet gas

Est. Surface Casing Depth (metres): 500
Est. Total Depth (metres): 1800 in the Mississippian Flett

2. Note: a) The well is a **TIGHT HOLE**;
b) The well will be drilled using the following mud systems:
i) Surface hole (0 to 500m) –Mil Gel Slurry;
ii) Intermediate hole (500 to top Garbutt Fm) –Flocculated Water System (Gypsum/Calcium Nitrate/Mil-SOS);
iii) Garbutt Fm to TD –Mil Gel/Chemical System;
d) It is estimated that each well will take 35 to 45 days to reach TD from the day the well is spudded;

3. Directions To Rig Location: See attached copy of survey plat.

GEOLOGICAL PROGRAM AND PROGNOSIS

(Preliminary Geological Program and Prognosis) **October 28, 1999**

1. General Well Info:

Well Name: **Paramount et al Liard NWT I-02**

Location: **60 degrees 11 minutes 34.008 sec N / 123 degrees 30 minutes 18.797 sec W**
Seismic line: 2-268; 129 m N of SP 500

UWI: **I-02-60-20-123-30**

Classification: Exploratory well

Primary Target: **Mississippian Mattson Sandstone** – sweet gas with minor condensate
Secondary Target(s): **Basal Cretaceous Chinkeh Sandstone** – sweet gas with minor condensate
Permian Fantasque – sweet gas
Mississippian Flett – sweet gas

Est. Surface Casing Depth (metres): 500
Est. Total Depth (metres): 1770 in the Mississippian Flett

2. Note: a) This well is a **TIGHT HOLE**;
b) The well will be drilled using the following mud systems:
i) surface hole (0 to 500m) – Mil Gel Slurry;
ii) intermediate hole (500 to intermediate casing set) – Carbo-TEQ L oil (Invert) mud system
iii) intermediate casing set (top of target depth) to TD – nitrified air hammer system.
c) At present we are proposing to not put any mud in the target section of the well. Logging will be undertaken in an under-balanced nitrified air environment. Mud will only be put in the hole if required to for safety reasons;
d) It is estimated that each well will take 35 to 45 days to reach TD from the day the well is spudded;

3. Directions To Rig Location: See attached copy of survey plat.

Down hole configuration unknown to Airborne Inspector

Mud pits slightly settled, holding approx. four inches of water, note arial photo. Access road beside lease, may be winter access only.

Initial String Weight: **39000.00daN**
Unseated String Weight: **40000.00daN**

Tool Chased Dist: **0.00m**
Mud Type: **GEL CHEMICAL**
Mud Weight: **1220.00kg/m³**
Amount of fill: **0.00m**
Amt of cushion: **0.00**
Type of cushion:

Water Loss: **6.50cm³**
Mud Drop: **NO**
VIS: **65.00S/L**
Filter Cake: **2.00mm**
Pump Time: **30min**
Reversed Out: **YES**

General Remarks:

Mechanically successful. *Test results suggest high permeability within the zone tested.

PREFLOW: Weak air blow increasing to strong in 20 seconds. Gas to surface in 2 minutes and 45 seconds, increasing throughout.

FINAL FLOW: Gas to surface immediately, 3 meter flare throughout.

***** See gas volume charts for gas rates.**

NOTE - See Alpine Telemetry report for real time data acquisition.

Recovery Description:

Total fluid recovery reversed out was 180 meters slightly oil stained gasfied drilling fluid.

Gas to surface.

APPENDIX VI

NWT Orogo™ File Information

Hydrocarbon Shows & DST Results

Hydrocarbon shows were generally very poor, typically consisting of variably minor to abundant, patchy to even, dull to bright yellow to yellow white to yellow green fluorescence and trace to minor thin, faint yellow white diffuse to streaming cut to questionable or no cut. Exceptions to the above occur in a number of intervals in the upper and middle Mattson, where shows were poor to fair; 1) 1015-1035m: minor to common oil at the wash, minor to common spotty to patchy dull yellow green fluorescence, minor to common poor slow streaming & thin diffuse cut; 2) 1059-1065m: common to abundant slightly patchy pale green to yellow green fluorescence, common fair, milky diffuse & streaming cut (minor oil sheen and strong condensate odour noted at wash); 3) 1080-1085m: traces of spotty bitumen, abundant moderate to bright pale yellow green fluorescence, common poor, thin diffuse cut; 4) 1275-1280m: minor to locally common spotty bitumen, common dull green fluorescence, common slow blooming & diffuse cut; 5) 1300-1305m: common dull green fluorescence with common poor thin diffuse & streaming cut (in a tight dolomite); and 6) 1383-1390m: common to abundant bitumen, common spotty dull to moderate fluorescence, common poor to fair streaming & diffuse cut.

A number of fair to good gas shows were recorded during the drilling of the Mattson; however, all of these were thin (i.e., 1-3 metres) An intermediate DST (#1) was run on the 1058-1068m interval; the preflow produced a strong air blow in 20 seconds with gas to surface in 3.75 minutes increasing throughout with a 2.5m flare. The VO had GTS immediately with a steady 2m flare. Flow rates indicate ~11,011 m^3/day from this zone. Liquid recovery was 180 metres of slightly oil-stained gasified mud. Three other DSTs were run in the Mattson with poor results; 1) DST #4 (1216-1240m – M3 Zone): weak air blow increasing to strong in 20 seconds becoming dead in 6 minutes (no GTS). The final flow had a strong blow immediately decreasing throughout to very weak air blow with no GTS. The liquid recovery was 711 metres of fresh water; 2) DST #5 (1134-1140m – M2 Zone): weak air blow 8cm into pail with no GTS. The final flow had a weak air blow to the bottom of the pail in 6 minutes with no GTS. The liquid recovery was 56 metres of fresh water; and 3) DST #6 (1075-1085m – M1 Zone): very weak air blow which remained throughout and no GTS. The final flow had a very weak air blow to the bottom of the pail in 15 minutes with no GTS. The liquid recovery was 197 metres of fresh water.

CONCLUSION: The Mattson has numerous fair to good reservoir-quality intervals at this locality and a number fair gas responses; however, most of the significant reservoir intervals either appear wet on induction logs or lack significant gas crossover. DSTs #4-6 showed the M1, M2 & M3 Zones (respectively) to be water-bearing. Despite these negative indicators, there are still some gas-bearing intervals present of commercial interest. This formation has fair economic potential at this location and good to excellent potential in the region.

LOGGING OPERATIONS SUMMARY

Date	From	To	Description of Operation
26 Nov 00	1245	2100	HDIL-ZDL-CN-GR-XYCAL
26 Nov 00	2100	0230	ML-MAC-GR-XYCAL
27 Nov 00	0230	1800	RCOR

REMARKS & COMMENTS

No problems on Runs #1 & 2 though there were some problems with repeatibility on the SP curve in the bottom ~100m. This was likely due to poor or no filtercake on this section with some flow from the formatio
There were 18 sidewall cores cut with 10 recovered.

INTRODUCTION

The Paramount et al Mount Coty I-02 well is located approximately 6 kilometres from the village of Fort Liard. This vertical exploration well was spudded on October 16, 2000 by Akita Drilling Rig #51 @ 22:00 hours. A Continental total gas detector and chromatograph was rigged up and running from surface to T.D. Samples were collected in 5 metre intervals from surface to F.T.D. The well reached F.T.D. at 1744 metres in carbonate of the Flett/Debolt November 25, 2000 at 22:45 hours. Sample quality was variable, ranging from generally adequate to periodically poor, due to a combination of factors which includes some inconsistent and improper sample-catching by rig personnel, as well as occasional problems with the mud-system and shakers.

The primary zone of interest was the Mississippian Mattson Formation, a predominantly clastic succession representing 5 different depositional environments of near shore marine to coastal plain systems. There were multiple zones within the succession occurring primarily in the coastal dune complex. Secondary targets in the well were the basal Cretaceous Chinkeh Formation, the Permian Fantasque Formation, and the Mississippian Flett/Debolt Formation. All zones of interest were gas targets.

A number of operational difficulties were encountered during the drilling of this well. Problems with hole deviation on the 311mm surface section necessitated drilling with relatively low FOB, slowing the progress of the well. At 257m a decision was taken to come out of the hole to change bits to 222mm in order to drill pilot hole to surface casing TD @ 514 metres. Initially the pilot hole was rotary-drilled but increasing deviation problems necessitated bringing in directional personnel. Directional tools were picked up at 330m and the remainder of the surface section was drilled with a mud-motor. Two days of reaming with the 311mm bit were required to complete the surface section which was completed on November 18. The main section from 514m to 1510m was drilled with a mud-motor to ensure control of potential deviation problems. At ~1510m a decision was taken to lay down the mud-motor and rotary-drill to FTD, which was completed with no problems on November 25.

One intermediate DST in the upper Mattson (i.e., DST #1: 1058-1068m) was conducted by Weatherford/Alpine Testing, commencing on November 1st and completed on November 2nd. Problems were encountered on this DST run. Upon pulling out of the hole after a successful test, it was discovered that part of the DST had been left in the hole (i.e., ~24m of the test tool from the safety joint down). An attempt to screw onto the safety joint was unsuccessful and a fishing operation was successfully conducted the following day.

A significant portion of the middle and lower sections of the Mattson Formation proved to be very hard drilling and resulted in extreme wear and short bit life. A total of 18 bits were required to drill ~681m of the Mattson, some of which were badly worn after as little as 8 hours of drilling. Problematically, the rocks in samples often did not appear hard enough to produce such extreme wear. The higher RPM involved with drilling with a mud-motor is one factor which likely contributed to shorter bit life. This theory appears to be supported by a significant increase in bit hours over the last few bits run in the lower Mattson after laying down the mud-motor and rotary-drilling to FTD.

Three logging runs were conducted upon reaching FTD, commencing on November 26th and completed on November 27th. The first two logging runs were conventional (i.e., #1: HDIL-ZDL-CN-GR-XYCAL; #2: ML-MAC-GR-XYCAL) and the third run was a sidewall core (i.e., #3: RCOR). A total of 18 sidewall cores were cut in three formations (i.e., 2 in the Flett/Debolt; 13 in the Mattson; 3 in the Chinkeh) with 10 cores recovered; 8 of the 13 cut in the Mattson were not recovered (see sidewall core report for details). After completion of logging a total of six DST's were run, commencing on November 27th and completed on December 2nd. Two DSTs were run in the Chinkeh (i.e., DST #2 (mis-run) & DST #7), three in the Mattson (i.e., DSTs #4-6) and one in the Flett/Debolt (i.e., DST #3). There were no significant problems encountered on the DST runs, excepting the mis-run on DST #2 when no packer seat was obtained (see attached DST reports for details). Production casing was run upon completion of the testing program.

SOLID PRODUCTION SERVICES
PRE-JOB/SAFETY SUMMARY

Company: Paramount Resources Ltd
Location: I-02
Start Date: 01/03/11 **Company Rep:** Al Ironside
Directions to Lease: From Hwy 77 and Liard turnoff. Left towards Liard. Go to bottom of hill. Turn left at Paramount Petita ice bridge. Go across ice bridge and follow for approx 1.0 Km. Go left to Km 5. Right into.

APPROVAL TO DRILL A WELL

National Energy Board | Office national de l'énergie

Exploratory [X] Development [ ] Delineation [ ] Service [ ]

APPROVAL TO DRILL A WELL

This application is submitted under Section 82 of the Canada Oil and Gas Drilling Regulations. When approved under Section 83 of the Regulations, it is the requisite approval for the commencement of drilling operations.

Well Name: Para et al Mount Coty I-02

Operator: Paramount Resources Ltd. Drilling Program No.:

Contractor: Precision Drilling Interest Identifier: EL 383

Drilling Rig or Unit: 379 Estimated Well Cost: $2,750,000.00

Location-Unit: I Section: 02 Grid Area: 60° 20', 123° 30°

Coordinates: Lat: 60° 11' 34.008" Long: 123° 30" 18.797"

Area: Fort Liard, NWT Field/Pool: N/A

Elevation-KB/RT: 374.6 m (ASL) GL/Seafloor: 369.1 m

Approx. Spud Date: August 31, 20000 Est. Days on Location: 35

Anticipated Total Depth: 1746 Target Horizons: Chinkeh, Mattson

EVALUATION PROGRAM

Ten-metre sample intervals

Five-metre sample intervals Surface to total depth.

Canned sample intervals Surface to total depth.

Conventional cores at 8m core in Mattson.

Logs and Tests HDIL/GR, MAC/GR/CAL, ZEL/ CNL/GR/ PE/XY CAL, EMT
1 DST in Frantasque, 2 DST's in Mattson

CASING AND CEMENTING PROGRAM

O.D. (mm)	Weight (kg/m)	Grade	Setting Depth (m KB)	Cementing Program (m³)
244.5	53.57	J-55	500	21.83m³ 0:1:0 "G"
177.8	38.69	J-55	1746	24.35m³ 0:1:0 "G"

B.O.P. Equipment 21 mPa Class IV Stack and Manifold with one (1) Flow Diverter, one (1) annular preventer, three rams (1 double gate, and 1 single gate) and double choke manifold.

Other Information: This well was originally approved December 13, 1999 with WID 1884 and UWI 300I02 60 20 12330. Due to constraints the well was not drilled at this time, and is planned to spud August 31, 2000. The two changes to the program are; (a) the 177.8mm csg. will be run to total depth and (b). the well will be drilled with gel-chem mud system only.

APPROVAL TO ALTER CONDITION OF A WELL

This application is to be submitted to the Chief Conservation Officer at least 45 days before commencement of operations.

Well Name: Para et al Mount Coty I-02 Area: Fort Liard, NWT

Operator: Paramount Resources Ltd. Contractor: Akita Rig

Drilling Rig or Unit: 51 Depth: 1744

Coordinates: Lat: 60° 11' 34.008" Long: 123° 30' 18.797"

Date ADW Issued: Date of last Operation: December 04, 2000

Elevation-KB/RT: 374.6 (ASL) GL/Seafloor: 369.1

TYPE OF OPERATION

With the drilling rig, complete the well over theMattson formation 1059m to 1067mKB and flow test the zone to obtain reservoir data.

SUMMARY OF PROPOSED OPERATIONS

1. Nipple up tubing spool and 179m BOP Stack.
2. Make a clean out trip with 73mm tubing and casing scrapper.
3. Run Cement Bond Log from PBTD (approximately 1729m) to 1800m.
4. Run in hole with tubing Conveyed Perforating Assembly and log in depth to perforate 1059m to 1067m underbalanced.
5. Land tubing, set packer and nipple up wellhead.
6. Drop bar and perforate.
7. With well shut in, run Static Gradient.
8. Flow test well for 3 days and shut in for build-up.
9. If requierd frac stimulate well and re-test.

APPROVAL TO ALTER CONDITION OF A WELL

Final Well Report
Paramount Resources Ltd.
Para et al Mount Coty I-02

National Energy Board | Office national de l'énergie

APPROVAL TO ALTER CONDITION OF A WELL

This application is to be submitted to the Chief Conservation Officer at least 45 days before commencement of operations.

Well Name: Para et al Mount Coty I-02 Area: Fort Liard, NWT

Operator: Paramount Resources Ltd. Contractor: Drive Well Servicing

Drilling Rig or Unit: 642 Depth: 1744m

Coordinates: Lat: 60°.11'.34.008" Long: 123°.30'.18.797"

Date ADW Issued: October 06, 2000 Date of last Operation: January 02, 2001

Elevation-KB/RT: 374.6 (ASL) GL/Sealoor: 369.1

TYPE OF OPERATION

To continue operations on well with a service rig, abandoning the Mattson perforations. The Mattson perforations as non productive for hydrocarbons and recompleting the wellin The Fantasque Formation for evsluation.

SUMMARY OF PROPOSED OPERATIONS

1. Move in service rig, kill well and install BOP's.
2. Recover packer and tubing assembly.
3. On wireline run and set Bridge Plug at 1045mKB.
4. Dump bail 8 liner meters cement on top of Bridge Plug.
5. Run in on tubing a TCP assembly andperforate the Fantasque 897 - 917m.
6. Frac stimulate the Fantasque perforations.
7. Perform flow evaluations.

Permit or Lease No.: EL383 Final Coordinates: Lat 60°.11'.34.008". Long 123°.30'.18.797"

Drilling Unit: Akita #51 Elevations: RKB: 374.6m GL: 369.1m

Spud Date: Oct 16 2000 Rig Released: Dec 4 2000 Total Depth: 1744mKB

RE: Dec 6 2000 (start)
Dec 9 2000 (finish)

CASING AND CEMENTING

O.D:	Weight:	Grade:	Depth Set:	Cement and Additives:
244.5mm	53.57Kg/m	J-55	514mKB	28t 0:1'0 'G' + 1%CaCl2
177.8mm	38.69Kg/m	J-55	1743mKB	34t 0:1:0 'G' + .8% NFL-2

PLUGGING PROGRAM

Approval of the following program was obtained by (person) N/A from

(person) by means of

on 19 .

Type of Plug:	Interval:	Felt:	Cement and Additives:

Lost Circulation/Overpressure Zones: N/A

Equipment left on Seafloor (Describe): N/A

Provision for Re-entry (Describe and attach sketch): N/A

Cores: Type: N/A Intervals:

Other Downhole Completion/Suspension Equipment: See attached downhole configuration diagram.

CERTIFICATION

I certify on the basis of personal knowledge of operations undertaken at the above named well that the above information is accurate.

2. AGAT sidewall core analysis report with phothographs.
3. Geological composite log.
4. Final survey plan.

A. INTRODUCTION

Paramount Resources Ltd. drilled a 1744 meter exploratory well, spudded on October 16, 2000 and finishing setting production casing to 1743 meters on December 4, 2000. The main target of the well was the Mattson at 1046 meters with the secondary targets being the Chinkeh Sand at 786 m, the Fantasque at 871 m, and the Flett at 1666 m.

The well potential was evaluated with the drilling rig over four intervals in the Mattson, two intervals in the Chinkeh, and one interval in the Debolt.

The drilling contractor was Akita Drilling Rig #51 based out of Calgary, Alberta. The rig was rated for 2500 m and had a 60 m^3 mud system.

The well was drilled on Exploration License No.381 in which Paramount Resources Ltd. has a 50 % working interest. Operating License: **Para et al Mount Coty I-02**
WID: 1884
File: 9211-P33-12-6
UWI: 300I026020123300
was issued to Paramount Resources Ltd. on October 6, 2000.

The well which is located approximately 6 km south of Fort Liard, lies along the length of the SE plunging anticline observed at the F-36 Mattson gas discovery. The exact co-ordinates of the well are as follows: Latitude: 60^0 11' 34.008" N
Longitude: 123^0 30' 18.797" W

A Cancor Rathole Inc. rathole rig was moved onto the location on October 9, 2000. The 508 mm conductor hole was drilled to a depth of 23 m. While drilling the conductor hole boulders were encountered to a depth of 10 m. The 406.4 mm heavy walled conductor pipe was set at 23 m and cemented in place.

Equipment for the drilling operations was barged up the Liard River in September and October, 2000. Akita drilling rig number 51 was moved onto the location starting on October 11, 2000. The diverter was nippled up and function tested with the HCR. The well spudded on October 16, 2000 at 22:00 hours. The 311 mm surface hole was drilled to 330 mKB when deviation problems were encountered. Directional drilling equipment was used to drill a 222 mm pilot hole to 514 mKB. The hole was then reamed out to 311 mm to 514 mKB. During the drilling of the surface hole there were mud ring problems encountered at approximately 235 mKB and minor amounts of losses to the formation from 150 – 250 mKB. Surface casing of 244.5 mm, 53.57 kg/m, J-55 LT&C casing was run and set at 514 mKB. The surface casing was cemented with 28 tonnes 0:1:0 'G' cement plus 1% $CaCl_2$. There were initial cement returns but returns were lost in the last 2 m^3 pumped. The plug was bumped with 10,500 kPa and the pressure held. The plug was down at 10:00 hours on October 24, 2000. A 1" pipe was run to 25 m and a 2.1 m^3 top cement job was performed with good cement returns.

The BOP's were installed, function tested, and pressure tested to 1500 kPa and 14000 kPa for 10 minutes each. The float collar and shoe were drilled out on October 25, 2000. A formation leak off test was done and the gradient was taken to 18 kPa/m with no formation breakdown. The 222 mm main hole was drilled with a gel-chemical mud system. Directional tools were utilized to control deviation problems to a depth of 1705 mKB. The remainder of the main hole was drilled conventionally to a total depth of 1743 mKB. After drilling to 1091 mKB DST #1 was run over the Mattson from 1058 – 1068 mKB. After pulling out of the hole with test tool #1 it was discovered that the tools had backed off at the safety sub. The lost tools were recovered and drilling resumed. After reaching total depth the open hole density, sonic, induction, and spectra logs were run from TD to the surface casing shoe. A rotary sidewall coring tool was used to attempt to cut 18 cores with successful recovery of 10 cores. Three additional DST's were run on the Mattson, two DST's were run on the Chinkeh, and one DST was run on the Debolt. A 177.8 mm, 38.69 kg/m, J-55, LT&C production casing was run and set at 1743 mKB. The casing was cemented with 34 tonnes 0:1:0 'G' cement plus 0.8% NFL-2. The plug was bumped with 14,400 kPa and the pressure held. The plug was down at 13:22 hours on December 5, 2000.

The drilling rig was left on the location to be used to complete the well. The completion details will be reported in a separate report.

B. GENERAL DATA

1. Well Name: Paramount et al Mount Coty I-02

Authority to Drill a Well No: 1884 Issued October 6. 2000

Exploration Agreement Number: EL 381

Location Unit: I

Section: 02

Grid Area: 60^0 20'. 123^0 30'

Classification: Exploration Well

2. Well Location: I-02 60^0 20' N, 123^0 30' W
Coordinates: Latitude: 60^0 11' 34.008"
Longitude: 123^0 30' 18.797"

3. Unique Well Identifier: 300I026020123301

4. Operator: Paramount Resources Ltd.

5. Contractor: Akita Drilling Ltd.

6. Drilling Unit: Rig #51

7. Support Craft (Helicopter): N/A

8 Drilling Unit Performance: N/A

9. Difficulties and Delays: No major delays or difficulties

10. Total Well Cost: $4.3 mm

11. Horizontal Deviated Wells Require Bottom Hole Co-ordinates:
Latitude: N/A
Longitude: N/A

C. SUMMARY OF DRILLING OPERATIONS

1. Elevations:
   Ground: 369.1 m
   KB: 374.6 m
   KB to Casing Flange: 5.0 m

2. Total Depth:
   FTD: 1744 mKB
   PBTD: 1733(+/-) mKB
   TVD: 1744 mKB

3. Date and Hour Spudded: October 16, 2000 at 22:00 hours

4. Date Drilling Completed: December 5, 2000

5. Date of Rig Release: December 5, 2000 (left on location to complete well)

6. Well status: Suspended

7. Hole Sizes and Depths:

Conductor Hole:	508 mm to 23 mKB
Surface Hole:	311 mm to 514 mKB
Main Hole:	222 mm to 1744 mKB

8. Casing and Cementing Record:

Conductor Hole:

Casing Size:	406 mm
Casing Weight:	Heavy Weight
Depth Set:	23 mKB
Cut Height:	At Surface
Date Set:	October 10, 2000
Cement Volume:	80 sacs
Cement Type:	None reported
Additives:	None reported

Surface Hole:

Casing Size:	244.5 mm
Casing Weight:	53.57 kg/m
Casing Grade:	J-55
Casing Make:	Ipsco
Number of Joints:	39
Thread:	LT&C

Depth Set:	514 mKB
Cut Height:	At Surface
Date Set:	October 25, 2000
Cement Volume:	28 Tonnes
Float Shoe Depth:	514.1 m
Float Collar Depth:	513.8 m
Cut Off Depth:	Surface
Cement Type:	0:1:0 'G' cement
Additives:	1.0% $CaCl_2$
Cement Top:	Surface
Casing Bowl Size:	279 mm X 244.5 mm X 21 MPa
Casing Bowl Make:	Streamflo

Main Hole:

Casing Size:	177.8 mm
Casing Weight:	38.68 kg/m
Casing Grade:	J-55
Casing Make:	Ipsco
Number of Joints:	138
Thread:	LT&C
Depth Set:	1744 mKB
Cut Height:	Surface
Date Set:	December 5, 2000
Cement Volume:	34 Tonnes
Float Shoe Depth:	1744 m
Float Collar Depth:	1733 m
Cut Off Depth:	Surface
Cement Type:	0:1:0 'G' cement
Additives:	0.8 NFL-2
Cement Top:	400(+/-) mKB, by cement bond log
Casing Bowl Size:	279 mm X 244.5 mm X 21 Mpa
Casing Bowl Make:	Streamflo

9. Sidetracked Hole: N/A

10. Drilling Fluid:

Conductor Hole: Water

Surface Hole: Gel - Chemical

Properties:	Viscosity:	40 - 88 sec/L
	Weight:	1080 - 1110 kg/m^3
	PH:	9 - 10
	Water loss:	Not controlled or reported
	Solids:	Not reported

	Gels:	Not reported
	Filter Cake:	Not reported
	PV / YP:	20 / 10

Main: Gel - Chemical

Properties:		
	Viscosity:	40 - 90 sec/L
	Weight:	1090 – 1290 kg/m^3
	PH:	9.5 – 10.5
	Water loss:	6.3 – 10.2 cc
	Solids:	6 - 8
	Gels:	4 – 8 / 10 - 18
	Filter Cake:	2
	PV / YP:	20 – 40 / 7 - 12

11. Fishing Operations: After pulling out of the hole with DST #1 it was discovered that the tools had backed off at the safety sub. An overshot was run and the lost tools were recovered on the first attempt.

12. Well Kicks and Well Control Operations: N/A

13. Formation Leak Off Tests:

At surface casing shoe:

Depth:	525 m
Fluid Density:	1000 kg/m^3
Applied Pressure:	4300 kPa
Hydrostatic Press:	5150 kPa
Mud Weight Equiv:	1830 kg/m^3
Casing Setting Depth:	514 mKB

The leak-off test was taken to a gradient of 18 kPa /m without breaking down the formation.

Geological Summary

Tops: See page 2 of the Geological Report in the Attachment Section.

Sample Descriptions: See pages 50 to 100 of the Geological Report in the Attachment Section.

Total Depth: 1744 mKB

Coring Record: No conventional coring done.

Rotary sidewall cores taken as follows:

Depth (mKB)	Formation	Comment
712	Chinkeh	Recovered whole plug
715	Chinkeh	Recovered whole plug
721	Chinkeh	Recovered whole plug
1060	Mattson	Recovered 5 wafers
1062	Mattson	Recd whole plug
1064.5	Mattson	Recovered whole plug
1080	Mattson	Recovered whole plug
1082	Mattson	Recovered whole plug
1136	Mattson	No recovery
1137	Mattson	No recovery
1225	Mattson	No recovery
1227	Mattson	No recovery
1229	Mattson	No recovery
1231	Mattson	No recovery
1233	Mattson	No recovery
1235	Mattson	Recovered trace rubble
1714	Flett/Debolt	Recovered whole plug
1720	Flett/Debolt	Recovered whole plug

See page 15 of the Geological Report in the Attachment Section for core plug descriptions.

GAS DETECTION REPORT

A gas detector was utilized from the drill out of the conductor pipe to total depth. The gas detector readings are included on the composite geological log at the end of the Geological Report in the Appendix Section.

DRILL STEM TESTS: See test reports in the Geological Report in the Attachment Section for details.

DST#1:	Mattson	1058.0 – 1068.0 mKB
DST#2:	Chinkeh	706.0 – 717.0 mKB (Misrun)
DST#3:	Debolt	1709.0 – 1727.0 mKB
DST#4:	Mattson	1216.0 – 1240.0 mKB

GAS, OIL, & WATER ANALYSES: Water analysis form the swabbing of the perforated section of the Mattson formation are included in the Attachment section.

FORMATION STIMULATION: N/A

FORMATION AND TEST RESULTS: N/A

DETAILED TEST PRESSURE DATA READINGS: N/A

E. ENVIRONMENTAL CONSIDERATIONS

There were no outstanding environmental considerations on this well. The gel-chem mud system used on the hole was treated on site and the solids were disposed of using the mix/bury/cover disposal method. In January 2001 the site was recontoured and there are no plans for any more work until this well is to be abandoned and reclaimed.

Calgary, Alberta T2P 5C5

INTRODUCTION

Paramount Resources Ltd. (Paramount) retained North Shore Environmental Consultants Inc. (North Shore) to conduct a Phase 1 Environmental Site Assessment (ESA) for the Para et al Fort Liard I-46 well located in the Northwest Territories (NWT) at Unit I, Section 46 Grid Area 60° 10', 123° 15' (Site).

The purpose of the Phase 1 ESA was to assess and qualify potential environmental concerns associated with the Site through a historic records review and site visit. The Phase 1 ESA was conducted in general accordance with the Canadian Standards Association (CSA) *Standard Z678-01: Phase I Environmental Site Assessment* (CSA, 2001). The Alberta Energy Regulator (AER) *Assessing Drilling Waste Disposal Areas: Compliance Option for Reclamation Certification* (AER, 2014) guidelines were used to assess the drilling waste associated with the Site.

FINDINGS

The Para et al Fort Liard I-46 well was spud on November 12, 1999 and the rig was released on January 15, 2000. The well was drilled to a final depth of 2,055 metres. The well did not produce. The wellsite is accessible by helicopter and winter road.

Infrastructure identified in association with the site includes a wellhead. There were no campsites, log decks, or borrow pits identified in association with the wellsite. A remote drilling waste disposal area (DWDA) was identified during the file review; however, the location of the remote DWDA is not known.

A review of 2001 aerial imagery of the site shows a potential area of concern near the east boundary of the site and the central portion of the lease appears to lack vegetation establishment.

Drilling Waste Disposal

The surface hole section of the well was drilled using a gel-chem drilling mud. According to file documentation, the drilling waste associated with the surface hole was disposed of at a remote DWDA. The intermediate hole was drilled with an invert mud system which was re-used at another site, and the main hole was underbalanced drilled with nitrogen as a carrying medium. Further details regarding drilling waste disposal locations related to the intermediate and main hole drilling waste was not available in the available documentation reviewed.

Drill stem tests (DSTs) 1 through 7 were conducted during intermediate and main hole drilling operations in December 1999 and January 2000 recovering gasified invert, invert, fresh water, invert-cut fresh water, salt water, and water-cut invert.

Formal drilling waste disposal documentation was not available for the well and as a result a Compliance Option 2 checklist and associated calculations were completed as per the *Assessing Drilling Waste Disposal Areas: Compliance Options for Reclamation Certification* document (AER, 2014). The surface hole drilling waste meets the requirements of the checklist and associated calculations and no further assessment of the remote DWDA is required. The drilling waste associated with the intermediate and main hole does not meet the requirements of the Compliance

Option 2 checklist, and as a result, further assessment of a potential on site DWDA is recommended. Construction reports noted that invert storage pits were constructed on site but it is not known if they were utilized or how they were disposed of.

The construction report also indicates that a flare pit was constructed on site; however, there is no indication that the flare pit was utilized.

Spills & Complaints

A review of the NWT Resource Wildlife and Economic Development's Hazardous Material Spill Database did not identify any spills associated with the I-46 wellsite.

An Environmental Inspection completed by Indian and Northern Affairs Canada was completed on September 20, 2000 and noted subsided areas that needed to be filled in.

Previous Assessments/Reports

There were no previous assessments or reports available for review.

Interviews

There were no Paramount operations personnel with historic knowledge of drilling or production activities at the Site available for an interview.

Site Visit

During the February 2017 site visit, North Shore noted that the wellhead was still in place. On site vegetation was not visible as the site was snow covered. An apparent subsided area was noted approximately east of well centre. There are no known borrow pits, log decks, or campsites associated with the wellsite.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information gathered for this Phase 1 ESA from the historic records review and the site inspection, North Shore concludes that there is a potential for environmental impact in connection with the site. A Phase 2 ESA is recommended to assess the following areas of potential concern:

- Well centre;
- Potential area of concern on the east side of the lease; and
- Potential on site DWDA.

DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

In the preparation of this report, selected Alberta Energy Regulator (AER) reference material has been gathered from AbaData™ (property of Abacus Datagraphics Ltd.), which is an online information source. The information provided by AbaData is received directly from the AER, electronically updated on a monthly basis and is assumed to be correct.

CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

SURVEYED FOR

PARAMOUNT RESOURCES LTD.

BY : R.O. BLACKALL, CLS
JUNE, 1999.

LEGEND

UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from the bearing 89° 31' 25" computed between Fd. CLS 77 Wellsite Control Monuments L-46-1 Grid Area 60° 10', 123° 15' and L-46-2 Grid Area 60° 10', 123° 15' and are referred to the Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995214. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... O
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic of Canada Monument 'Petitot' Elev. = 218.241m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, R.O. Blackall, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

Explanatory Remarks

Please take note that on September 20, 2000, Resource Management Officers Darren Unrau and Daniel Quevillon inspected the above noted areas by air to monitor compliance with land use permit operating conditions. Also accompanying the DIAND officer was Ms. Emma Pike, Regulatory Officer for the Mackenzie Valley Land and Water Board in Yellowknife.

Barge Landing and Camp and fuel storage

The barge landing was operational and in good condition. A drainage trench was constructed near the barge landing area eliminating erosion problems at the Liard River. The equipment and rig for the I-03 project was being stored on this site and in a coordinated manner. The camp is operational and has a sump directly behind it. The outdoor sump is fenced in. This waste disposal method is acceptable. The fuel is kept in a berm which is lined with a HDPE impermeable liner. No spills were noted during this inspection.

All weather road from the barge landing to I-03 ROW access

The all weather road leading from the barge landing to the I-03 well site ROW was nearly completed. They still needed clay to cap that part of the road. The work on this road is coming along at a slow pace due to the heavy rains the Fort Liard area.

ROW into I-03 and camp and well site

The ROW which lead to the I-03 well site was still under construction. Clay is also needed there to cap the road. This whole area was visibly wet and this was being caused by the continuous rain falls in the area. The camp area is under construction, all trees have been cut down and removed. All trees have also been removed from the well site area and they were leveling the site with a dozer.

Erosion problem

It is important to note that we were informed by the consultant on site that an area of concern was going to be re-mediated as soon as the ground was frozen. I am talking about the bridge at kilometer 9. This bridge will have to be removed and installed again in an appropriate manner. This area is very wet and it is now known that beavers frequent this location. All of these circumstances will have to be taken in consideration when putting the bridge back in. It is highly recommended that Paramount Resources Ltd. submit an engineered plan showing how this bridge is being installed along with elaborating on erosion control. Now, should this bridge and all other bridges leading to A-01 be temporary winter bridges, they should all have been removed last spring. We would appreciate clarification of the status of these bridges as soon as possible.

Well sites O-35, M-25 and I-46

All the above noted well sites were inspected and it is recommended that Paramount Resources Ltd. go in these locations and fill in the sumps that have slumped. All well sites have these slumped areas.

F-36 battery site

All areas inspected were found to be acceptable at this time.

All of the areas inspected were found to be acceptable at this time.

Should you have any questions or concerns relating to this matter, please do not hesitate in contacting this office anytime at (867) 695-2626.

Section 227 of the Environmental Protection and Enhancement Act

Offences s. 227 A person who

(a) knowingly provides false or misleading information pursuant to a requirement under this Act to provide information,
(b) provides false or misleading information pursuant to a requirement under this Act to provide information

is guilty of an offence.

Penalties s. 228(1) A person who commits an offence referred to in section 60, 87, 108(1), 109(1) or 227(a), (d), (f) or (h) is liable to

(a) in the case of an individual, to a fine or not more than $100 000 or to imprisonment for a period of not more than 2 years or to both fine and imprisonment, or
(b) in the case of a corporation, to a fine of not more than $1 000 000.

(2) A person who commits an offence referred to in section 61, 67, 75, 76, 79, 88, 108(2), 109(2) 110(1) or (2), 111, 112, 137, 148, 149, 155, 157, 163, 169, 170, 173, 176, 188, 191, 192, 209, 227(b), (c), (e), (g), or (i) or 251 is liable.

(a) in the case of an individual, to a fine or not more than $50 000, or
(b) in the case of a corporation, to a fine of not more than $500 000.

E. ENVIRONMENTAL CONSIDERATIONS

There are no known outstanding environmental considerations on this well. The gel-chem mud system used on the surface hole was hauled and treated at a remote sump. The invert mud system used for the intermediate hole was re-used at another location. The main hole was drilled underbalanced with noitrogen as a carrying medium.

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information:

Unique Identifier (UI)	Para et al Fort Liard I-46
Spud Date	November 12, 1999
Well Depth	2,055 m

1.1 Disposal Method (if known)*: Surface Hole: Mix-bury-cover at remote sump, Intermediate Hole: Invert mud re-used at another location, Main Hole: Unknown, assumed mix bury cover

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: Remote sump location unknown, assumed on site DWDA

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.
For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☐	☒
If yes, were the disposal areas separate from one another?	☐ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☒ ☐ ☒ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☐ ☒ ☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☒ ☐	☐ ☐ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☐	☐ Phase 2 required ☒ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☐	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used?	☒	☐
If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒ Phase 2 required

	Yes	No
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☐	☐ ☒ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☐	☐ ☒ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required

	Yes	No
3.3 Was zinc carbonate added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ ☐ Show calculation on attached form	☒ ☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☒ Show calculation on attached form	☐ ☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*? If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available? If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐ ☐ ☐	☒ ☐ Phase 2 required ☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling? If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐ ☐	☐ ☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☒ (Surface Hole) Show calculation on attached form	☒ (Intermediate Hole) Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Mud Additives (Attach additional pages if necessary.)

Product Name	Amount Used	Brief Description of Product
Surface Hole – Gel Chem System		
Gel	224 sacks	Viscosifier
Soda Ash	5 sacks	Calcium remover
Desco	3 sacks	Thinner, dispersant *contains chrome*
Sawdust	23 sacks	Lost circulation material
Intermediate Hole – Invert System		
Barite	484 sacks	Weighting material
Bentone	36 sacks	Viscosifier
Lime	39 sacks	Alkalinity, pH control
Soluflake	13 sacks	Lost circulation material
Crb	1 sack	Unknown mud additive
Carbo Teq E Invert	11.5 m^3, 2 bbl	Invert mud
Calcium Carbonate	68 sacks	Weighting material
Calcium Chloride	20 sacks	Weighting material
Mil Clean	2 bbl	Surface Active Agent
Floor Dry	4 sacks	Oil absorbent material
DFE	2 sacks	Unknown mud additive
Emulsifier	2 sacks	Emulsifier
B Mc	15 sacks	Unknown mud additive
Sawdust	30 sacks	Lost circulation material

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

A Notification of Drilling Waste Disposal document was not available for review. File documentation noted that surface hole gel-chem drilling waste was disposed at a remote drilling waste disposal area (DWDA) in an unknown location. The intermediate hole was drilled with invert which was reused at another site, and the main hole was underbalanced drilled with nitrogen as a carrying medium.

The surface hole drilling waste meets the requirements of the Compliance Option 2 checklist and further assessment of the remote DWDA is not recommended. The location of the remote DWDA is unknown.

The intermediate and main hole drilling waste do not meet the requirements of the Compliance Option 2 checklist as it fails the salt calculation and unknown drilling mud additives were used. Due to a lack of details as to where the intermediate and main hole drilling waste was disposed, it is recommended that potential drilling waste disposal areas be assessed at the I-46 wellsite. Construction reports noted that invert storage pits were constructed on site but it is not known if they were utilized or how they

were disposed of.

Location: Para et al Fort Liard I-46 **Spud:** November 12, 1999

Surface Hole

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre
3	÷	505	÷	3	=	0.002

Result
PASS

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Drill Stem Test Returns for Option 2

Location: **Spud:**

Hydrocarbons

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return in metres, the percent oil content of the DST fluid, the well depth in metres and the mix ratio. The spreadsheet will calculate the post disposal oil concentration If this value is greater than **0.10%** (dry weight) in subsoil or **0.50%** (dry weight) in topsoil, a Phase 2 ESA (Compliance Option 3) is required.

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)		Oil Content (%)*		Vol. of Oil (m^3 x 100)
65	40	0.132665	x	100.00%	=	13.2665
65	2	0.00663325	x	100.00%	=	0.663325
65	1000	3.316625	x	100.00%	=	331.6625
65	40	0.132665	x	100.00%	=	13.2665
		0	x		=	0
		0	x		=	0
				Total Volume of Oil	=	358.858825
					÷	0.6
				Well Depth (m)	÷	2055
				Mix Ratio**	÷	3
				Post-Disposal Oil Concentration (%)	=	0.10

Result
PASS

* Actual measured oil concentration must be used if available. If only visual descriptions are available then use the following to estimate oil concentration:

Flecked = 5%
Emulsion = 25%
Oil or oil-cut mud= 100%

Do not include gas-cut mud or mud with no indication of oil.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Drill Stem Test Return Calculations for Compliance Option Two

Location: Para et al Fort Liard I-46 **Spud:** November 12, 1999

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
65	40	0.132665	x	215000	÷	7600	=	3.75302303
65	2	0.00663325	x	215000	÷	7600	=	0.18765115
65	1643	5.449214875	x	215000	÷	7600	=	154.155421
65	350	1.16081875	x	22000	÷	7600	=	3.3602648
65	40	0.132665	x	215000	÷	7600	=	3.75302303
65	120	0.397995	x	50000	÷	7600	=	2.61838816
				Total number of sacks			=	167.827771

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

Phase 2 Environmental Site Assessment

North Shore Environmental Consultants Inc. is pleased to submit our Phase 2 Environmental Site Assessment report for the I-46 wellsite to Paramount Resources Ltd.

North Shore appreciated the opportunity to work on this project and if we can provide clarification of any part of this report, please call the undersigned at (780) 467-3354.

Yours truly,

North Shore Environmental Consultants Inc.

Phase 2 Environmental Site Assessment
May 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) for the Para et al Fort Liard I-46 wellsite located in the Northwest Territories (NWT) at Unit I, Section 46 Grid Area 60° 10', 123° 15' (Site). The site is located near Fort Liard, Northwest Territories. The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017.

Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines. The areas of potential environmental concern included the following:

- Well centre
- East potential area of concern
- Drilling waste disposal area

On February 9, 2017, 27 boreholes were advanced at the Site. Based on a review of the analytical data, field observations, and field screening information from the Phase 2, ten of eleven soil samples at well centre reported arsenic guideline exceedences. Further characterization of background soil quality is recommended.

1 INTRODUCTION

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the Para et al Fort Liard I-46 wellsite (Site) located near Fort Liard, Northwest Territories.

1.1 Objective

The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017.

1.2 Scope of Work

The scope of work for the Phase 2 ESA included the following:

- Review background information to assist with establishing site specific protocols.
- Prepare for ground disturbance activities. The defined work area included the lease and a 30 meter (m) buffer zone around the lease boundary.
- Supervise two sets of private utility locating surrounding the proposed ground disturbance locations.
- Conduct a tailgate safety meeting prior to initiating work each day at the Site. This includes North Shore personnel and contractors.
- Characterize and delineate any suspected impacted areas and advance two control boreholes near the site boundary location in a landscape representative of onsite topography.
- Log soil stratigraphy according to the Canadian System of Soil Classification (CSSC) (Soil Classification Working Group, 1998) with additional comments on potential impacts. Collect samples from each borehole and record organic vapor readings.
- Collect borehole soil samples as required based on field screening results.
- Collect field duplicates for every ten samples submitted for analysis.
- Submit selected soil samples for laboratory analysis to determine concentrations of suspected contaminants and background concentrations for control soil.
- Prepare a Phase 2 ESA report to document the results of the laboratory analysis.

2 BACKGROUND

2.1 Site Description

The Site is located at surface location Unit I, Section 46 Grid Area 60° 10', 123° 15', approximately 17 kilometers (km) southeast of Fort Liard, Northwest Territories. Access to the Site is from the west. A location map of the Site is included as Figure 1 and a survey plan is included in Appendix A.

2.2 Land Use and Receptors

The lease is situated on Crown land in a mixed-wood forested area. The Site has not been reclaimed, but natural encroachment from the surrounding forest is evident throughout the lease. An aerial photograph or satellite image of the quarter section is included as Figure 2. Site photographs are included as Appendix B.

2.3 Site History and Infrastructure

The Para et al Fort Liard I-46 well was spud on November 12, 1999 and the rig was released on January 15, 2000. The well was drilled to a final depth of 2,055 meters. The well did not produce.

Infrastructure identified in association with the site includes a wellhead. There were no campsites, log decks, or borrow pits identified in association with the wellsite. A remote drilling waste disposal area (DWDA) was identified during the file review; however, the location of the remote DWDA is not known. Site photographs are included in Appendix B.

2.4 Previous Environmental Work

A Phase 1 ESA was completed by North Shore in March 2017 (North Shore, 2017). There was a wellhead surrounded by a conductor barrel with grate paneling present on the site at the time of the February 2017 site visit conducted by North Shore. Based on the information gathered from the Phase 1 ESA records, and the February 2017 site visit, North Shore concluded that there was a potential for environmental impact associated with the Site. North Shore recommended intrusive sampling on the Site to assess the well centre, potential area of concern of the east side of the lease and the on site drilling waste disposal area.

3 METHODOLOGY

3.1 Safe Work Procedures

North Shore personnel adhered to Paramount's policies and procedures to complete the assessment and investigation program. Standard oilfield personal-protective equipment (hard hat, steel-toed boots, safety glasses, and fire retardant coveralls) were worn by all personnel on-site. A calibrated four way gas monitor for H2S, O2, CO, and organic vapors was also carried by each person participating in the field work. Nitrile gloves were worn when handling soil samples. All personnel onsite were required to possess copies of the applicable safety certification (Paramount Orientation, Ground Disturbance Level 2, H_2S Alive, Transportation of Dangerous Goods, Workplace Hazardous Material Information System, and Standard Level First Aid). North Shore personnel acquired a Paramount Safe Work Permit prior to commencing fieldwork and a tailgate safety meeting was conducted at the beginning of each work day.

Prior to initiating any ground disturbance the proposed assessment area was swept twice by a third party company for the presence of buried facilities. The wellhead surrounded by a conductor barrel with grate paneling was the only facilities present at the time of assessment. All ground disturbance documentation was peer reviewed prior to commencing the fieldwork.

3.2 Drilling Program

On February 9, 2017, 27 boreholes (17C01 through 17C02 and 17BH01 through 17BH25) were advanced as part of the drilling program (Figure 3). Boreholes were completed using a tracked B-57 drill rig equipped with 15 cm solid-stem augers. Boreholes were completed to a maximum depth of 6.0 mbgl (meters below ground level), depending on the assessment location and subsurface conditions.

Delineation of potentially impacted areas was based on field screening, visual cues, and professional judgment. Vertical and horizontal delineations were completed to determine the spatial extent of the potentially impacted material. If potentially impacted material was identified during borehole logging, vertical delineation was completed by sampling parameters above the suspected impact zone and to a depth of 1.0 m below the suspected lowest point of contamination. Horizontal delineation was completed by advancing boreholes in 5.0 m horizontal increments in each direction (north, south, east, and west) until clean material, as determined by field screening and professional judgment, was identified. Select delineation samples were collected for laboratory analyses. The GPS location, reference from a fixed point, and rationale of each borehole is included in the borehole logs in Appendix C.

3.3 Soil Sampling

Throughout the sample collection process, North Shore adhered to sampling procedures described in the Canadian Council of Ministers of Environment (CCME) Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites (CCME, 1993). Samples of the recovered soil were visually inspected for evidence of impacts such as free product, staining, or discoloration. The outermost layer of the samples was trimmed using a soil tool to avoid cross-contamination. North Shore personnel wore a pair of clean, chemical resistant nitrile gloves for each soil sample collected as an added preventative cross-contamination measure.

Soil vapor concentrations were field screened for volatile hydrocarbon constituents using an RKI Eagle gas detector (RKI Eagle), calibrated with a 400 parts per million (ppm) concentration of hexane gas with the methane elimination switch turned on. Samples selected for vapor screening were placed into plastic bags, sealed, agitated, and allowed to volatilize. Volatile organic compounds (VOCs) that accumulated within the headspace were then measured in ppm and recorded on the borehole logs.

Soil samples were also field screened for salinity related parameters by measuring electrical conductivity (EC) using a Spectrum Technologies Inc. Field Scout Soil and Water EC Meter (EC Probe). Prior to sampling, the EC probe was calibrated with a 2.76 dS/m calibration solution. Once the soil on the auger had been trimmed, the EC probe was inserted directly into the soil media in order to obtain an in-situ EC reading. The EC reading was allowed to stabilize for three seconds before being recorded in the field documents.

All soil samples were placed in sealable plastic bags for field screening organic vapors while 40 mL vials with methanol and 125 mL glass jars with Teflon-lined lids were used for organic analyses. Jarred samples were packed tightly to minimize headspace, help prevent the loss of VOCs, and minimize biodegradation. All samples collected were labeled and placed in a cooler with ice or ice packs to

maintain a temperature as close to 4°C as possible. Soil samples were transported to an accredited laboratory for analysis. Standard chain of custody protocols were followed during the transport of the samples.

Soil characteristics at each borehole location were described using classification procedures and terminology from The Canadian System of Soil Classification (Soil Classification Working Group, 1998).

3.4 Quality Assurance and Quality Control

3.4.1 Laboratory QA/QC

Soil samples collected during the February 9, 2017 sampling event were submitted to AGAT Laboratory (AGAT) in Calgary, Alberta for analysis. The analytical suite was selected based on regulated compounds that are typically found on oil and gas sites.

AGAT is a Standards Council of Canada (SCC), ISO 9000 Series and ISO/IEC 17025 accredited laboratory and Canadian Association of Environmental Analytical Laboratories (CAEAL) accredited laboratory that uses ESRD recognized methods to conduct laboratory analyses. Method blanks, control standards samples, Certified Reference Material (CRM) standards, method spikes, replicates, duplicates, and instrument blanks are routinely analyzed as part of the QA/QC program at the laboratory. AGAT has indicated that analytical data is only released if it passes the laboratory QA/QC procedures. A summary of the QA/QC procedures adopted by AGAT during the analyses of samples for petroleum hydrocarbon concentrations, salinity parameters, and metals concentrations is included in Appendix D.

4 COMPARISON GUIDELINES

4.1 Comparison Guidelines

Selection of the appropriate set of guidelines is based on the texture of the dominant soil type along with current and potential future land use as determined in the assessment. Where both fine and coarse grain strata are present, grain size is determined by the stratum governing horizontal and vertical migration to a receptor. Seven soil samples collected from depths ranging from 0.0 to 6.0 mbgl were analyzed for particle size (75 micron sieve). All seven samples were reported to be coarse-grained. As a result, the guidelines for coarse-grained soils were applied.

As per the direction of Paramount, the guidelines for residential/parkland land use were applied to the Site and laboratory values were compared to the following:

- Soil regulated metals, benzene, toluene, ethylbenzene, and xylenes (BTEX), and PHC fractions F1-F4 results were compared to the Canadian Council of Ministers of the Environment (CCME) - Tier 1 Soil Remediation Guidelines (CCME, 2017).
- Saturated paste boron results were compared to the AEP Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1 Guidelines; AEP, 2016a).

- Soil EC, Sodium Adsorption Ration (SAR) and pH values were compared to Environmental Guidelines for Contaminated Site Remediation (EGCSR, 2003) Environment Division. Government of the Northwest Territories (EGCSR, 2003).

4.2 Background Control Characterization and Salinity Guidelines

During the Phase 2 ESA, two control boreholes (17C01 to 17C02) were advanced in undisturbed background locations to a maximum depth of 6.0 mbgl. The purpose of the control sampling was to characterize background soil conditions and to determine the generic salt remediation guideline values for the Site.

Six subsoil samples were collected from the two control locations and were submitted for detailed salinity and/or arsenic analyses.

All EC and SAR analytical results complied with the EGCSR Guidelines. Five of the samples reported pH values ranging from 4.09 to 5.48, indicating naturally occurring acidic soils in the area. The onsite values were compared to the same general EC and SAR range. All control samples reported metals values that met the applicable remediation guidelines (Tables 1 through 3).

5 RESULTS OF FIELD INVESTIGATION

5.1 Stratigraphy

Based on the boreholes advanced during the drilling program, soil conditions generally consisted of coarse sand to 6.0 mbgl.

5.2 Soil Results

Soil results for areas of concern are summarized in Sections 5.2.1 through 5.2.3. The laboratory analyses for soil samples are presented in Tables 1 through 3 along with the applicable comparison guidelines.

5.2.1 Well Centre

One borehole (17BH01) was advanced to assess well centre. Three soil samples (17BH01 0.8 – 1.0 mbgl, 17BH01 2.2 – 2.5 mbgl and 17BH01 4.3-4.5 mbgl) were analyzed for petroleum hydrocarbon, metal, and/or detailed salinity parameters. Samples 17BH01 0.8 – 1.0 mbgl and 17BH01 2.2 – 2.5 mbgl reported arsenic concentration with values of 42.7 mg/kg and 26.8 mg/kg, and pH values of 4.04 and 4.01, respectively. All of other samples met the applicable guidelines for hydrocarbon concentrations, metals, and detailed salinity parameters.

Four boreholes (17BH02 through 17BH05) were advanced to delineate well centre. Eight soil samples (17BH02 0.8 – 1.0 mbgl, 17BH02 2.2 – 2.5 mbgl, 17BH03 0.8 – 1.0 mbgl, 17BH03 2.2 – 2.5 mbgl, 17BH04 0.8 – 1.0 mbgl, 17BH04 2.2 – 2.5 mbgl, 17BH05 0.8 – 1.0 mbgl, and 17BH05 2.2 – 2.5 mbgl) were analyzed for arsenic. All of the samples reported arsenic values ranging from 15.4 mg/kg to 48.1 mg/kg. The exceedances were not delineated vertically or horizontally.

5.2.2 East Potential Area of Concern

One exploratory borehole (17BH19) was drilled within the area of potential concern on the east side of the lease. A natural, undisturbed soil profile with non-detect field screening values was encountered in the borehole; therefore, no samples were submitted for laboratory analysis.

5.2.3 Exploratory Boreholes

No visual indicators (i.e., subsided areas or atypical vegetation) were present during the Phase 2 to suggest the possible location of the DWDA. Therefore, 12 exploratory boreholes (17BH06 through 17BH17) were advanced within a 30 m radius of the wellbore and six exploratory boreholes (17BH18 and 17BH20 through 17BH25) were advanced in the corners of the lease in an effort to locate the potential DWDA. Field observations did not identify any material indicative of drilling waste. Two soil samples (17BH06 1.7 – 1.9 mbgl and 17BH23 1.7 – 1.9 mbgl) that reported the highest field screening values for EC and VOCs and were analyzed for hydrocarbon and detailed salinity parameters. All of the samples met applicable guidelines.

5.3 Quality Assurance/Quality Control

Quality assurance and quality control for analytical data was also assessed by comparing analytical results from select samples to duplicate samples obtained from the same sample location. Primary and duplicate samples were compared and the relative percent differences (RPD) were calculated.

RPD criteria has been applied to field duplicates in order to evaluate the precision of the results. If both the original and duplicate sample concentrations are greater than or equal to five times the laboratory detection limit for a given parameter, the RPD must be less than or equal to 40% (water) and 60% (soils) (CCME, 2016). If the results lie outside of the range, they should be considered estimates only. The results of North Shore's QA/QC program are discussed in Section 5.3.1.

5.3.1 North Shore Environmental's QA/QC Program

Two soil sampling QA/QC measurements were conducted by duplicating soil samples 17C01 2.8 – 3.0 mbgl and 17BH01 0.8 – 1.0 mbgl. Laboratory comparisons reported good reproducibility for all benzene, toluene, ethylbenzene and total xylene (BTEX), petroleum hydrocarbon (PHC) (F1 – F4), particle size, metals, soluble ions, pH, EC and SAR values. The calculated RPD value for arsenic suggests that the sample shows good reproducibility for the purposes of this project. It should be noted that parameters with criteria (BTEX, PHC (F1 – F4), metals, pH, EC and SAR) all met the applicable criteria or were similar to natural background soil values. RPD value calculations and results for the QA/QC measurements are included in Tables 4 through 6.

6 SUMMARY AND CONCLUSIONS

North Shore completed a Phase 2 ESA on the Site on February 10, 2017. The assessment consisted of an investigation of the well centre, potential area of concern of the east side of the lease and the potential on site drilling waste disposal area. A total of 27 boreholes were advanced, including two control locations.

Eleven soil samples collected from well centre did not meet the applicable remediation guidelines for arsenic. The impacted area was not delineated horizontally or vertically.

All of the remaining analyzed samples met the applicable remediation guidelines. Based on field observations and laboratory analysis, and naturally occurring arsenic in the general area, further characterization of background soils is recommended.

7 DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

8 CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

SURVEYED FOR

PARAMOUNT RESOURCES LTD.

BY : R.O. BLACKALL, CLS
JUNE, 1999.

LEGEND

UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from the bearing 89° 31' 25" computed between Fd. CLS 77 Wellsite Control Monuments L-46-1 Grid Area 60° 10', 123° 15' and L-46-2 Grid Area 60° 10', 123° 15' and are referred to the Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995214. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... O
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic of Canada Monument 'Petitot' Elev. = 218.241m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, R.O. Blackall, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

R.O. Blackall, CLS

Sworn before me at Fort St. John, this 06th day of July, 1999.

A Commissioner for Oaths

SOIL ANALYSIS REVIEWED BY: Melinda Guay, Technical Reviewer

TRACE ORGANICS REVIEWED BY: Ngoc (Ruby) Vu, Lab Technician

DATE REPORTED: Mar 02, 2017

PAGES (INCLUDING COVER): 17

VERSION*: 3

Should you require any information regarding this analysis please contact your client services representative at (780) 395-2525

*NOTES

VERSION 3:Arsenic added to samples: 287, 290, 294, 302, 304, 307. (Mar 02/17 GH)

Version 2 supersedes version 1 issued on March 2nd 2017. Added total arsenic to samples: 322, 323, 324, 325, 326, 328, 329, 334 and 335 - March 31st 2017 CS.

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8192287-8192339 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8192313-8192339 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

II. Historical Borehole Logs, Drawings and Tables
III. Water Well and Water Body Search Results

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen completed a Desktop Remediation™ (DTR) review of historical environmental site assessment information and data for the Paramount former wellsite *PARA ET AL* I-46 - 60-10-123-15, with Well Identification number 1871 (the Site). The Site is in the South Liard field of the Northwest Territories.

The scope of work for the DTR involved reviewing and assessing available analytical data to determine the applicability of various guidelines based on land uses and receptors at the Site. Recommendations for remediation at the Site will be provided based on regulatory requirements.

The areas of potential environmental concern (APECs) identified in the 2017 Phase 1 ESA for the Site by North Shore Environmental Limited (North Shore) were the wellbore, the potential on-site drilling waste disposal area (DWDA), and a potential area of concern on the east side of the lease (North Shore, 2017a). The area of environmental concern (AECs) identified in the 2017 Phase 2 ESA for the Site was the wellbore area, due to exceedances of arsenic in soil.

2. CURRENT SITE DESCRIPTION

The Site was winter-access, and the well did not produce. The well was drilled to a depth of 2055 meters between November 12, 1999 and January 15, 2000, in the South Liard field, approximately 60 kilometres (km) southwest of Fort Liard, Northwest Territories (NT). The Site location is presented on Drawing PAR6209-001.

The Site is approximately 150m x 150m, with a 40m x 60m campsite west along the main access road. Site details and surrounding land uses are shown on Drawing PAR6209-002 and PAR6209-003. Table A below summarizes general information regarding the Site's location, topography, hydrogeology, and surrounding land uses.

TABLE A: Summary of General Information

Item	Description
Site Latitude & Longitude	60° 05' 32.23" N, 123° 23' 00.00" W
NTS Map	I-46 - 60°-00'-123°-15'
Well ID #	1871
Land Owner(s)	Crown
Drilling Dates	November 12, 1999 to January 15, 2000
Total Depth	2055m
Site Description & Size	Site dimensions are approximately 150 m x 150 m square, with one corner aligned to the north, and access from the southwest.
Site Facilities	Wellhead was located at the centre of the Site;
Topography:	
Regional Surface Grade	The regional grade is gently sloping north (0-1%) towards the Liard River
On Site Drainage	The lease slopes south (0-1%) based on the survey details
Surface Cover	In 2017 the Site was covered in birch saplings.
Geology	Bedrock geology consists of Wapiti Formation which is comprised fine clastic sedimentary rocks, Conglomerate, fine to coarse grained sandstone; carbonaceous shale and coal from cretaceous geological period [BCGS online map resource].
Hydrology & Hydrogeology:	
Nearest Surface Water	Government of NWT ATLAS website shows no water bodies within 500m of the Site. A low area is present ~1200m southeast of the Site.
Water Wells	Government of NWT ATLAS website shows no water wells within 500m of the Site (Appendix III).
Depth to Groundwater	Unknown
Groundwater Flow	Unknown but likely to the east towards the unnamed tributary of the Liard River
Surrounding Land Use (Site)	
North	Mixed wood Boreal forest

Item	Description
East	Mixed wood Boreal Forest
South	Mixed wood Boreal Forest
West	Mixed wood Boreal Forest

3. HISTORICAL REVIEW

The scope of this report included a review of available historical environmental site assessment (ESA) information for the Site. Findings from the review of the available reports are summarized below.

3.1 Phase 1 ESA – 2017

North Shore Environmental Consultants Inc. (North Shore) completed a Phase 1 ESA on the Site, published in March of 2017. The Phase 1 ESA indicated the well was a drilled and abandoned well spud in 1999, with a wellhead, conductor barrel and a grate panel as the only structure present at the time of assessment. Based on Compliance Option #2 checklist due to lack of formal drilling waste documentation, the on-site DWDA required assessment for unknown disposal of invert drilling fluid used in the well (North Shore, 2017a).

3.2 Phase 2 ESA - 2017

North Shore completed a Phase 2 ESA on the Site, published in May of 2017. The Phase 2 ESA investigated the wellbore, east potential area of concern, and suspected on-site DWDA at the Site, and consisted of 27 boreholes advanced at the Site, to a maximum depth of 6.5 meters below ground (mbg). Analytical results from the Phase 2 ESA were compared to the following guidelines for the respective parameters: Canadian Council of Ministers of the Environment (CCME) 2017 Tier 1 Soil Remediation Guidelines and the 2003 Northwest Territories Environmental Guidelines for Contaminated Site Remediation for pH and salinity parameters (North Shore, 2017b). Results from the Phase 2 ESA showed low pH across the Site, and elevated arsenic that was not comparable to background levels in the surface and the subsurface of the wellbore area. Results from shallow soil samples (0.8-1.0 mbg) showed arsenic ranged from 15.4 to 42.7 mg/kg; and ranged from 15.7 to 26.8 mg/kg in the subsurface 2.2-2.5 mbg. One soil sample collected from the wellbore area at a depth of 4.3-4.5 mbg had an arsenic concentration of 10.9 mg/kg, below the applicable guideline of 12mg/kg at the site (North Shore, 2017b). The recommendation from the Phase 2 ESA was further characterization of the background soil at the Site (North Shore, 2017b).

4. SUMMARY OF SITE SOIL CONDITIONS

Based on a review of historical reports, SynergyAspen developed a list of areas of environmental concern (AECs) for the Site. The AECs, along with contaminants of concern (COCs) and associated regulated parameters, are shown on Table B below. The AEC is shown in Drawing PAR6209-002.

TABLE B: AECs and Associated COCs in Soil

AEC Label	AECs	Impacted Borehole(s)	COCs (depth)
A	Wellbore	17BH01; 17BH02; 17BH03; 17BH04; 17BH05	Arsenic (0.8-2.5 mbg)

Soil Stratigraphy

There were two background boreholes assessed at the Site in the North Shore 2017 Phase 2 ESA. Soil stratigraphy at background borehole 17C01 was coarse-grained sand and gravel to 6.5mbg, and in 17C02 was coarse-grained sand to 4.5 mbg, the maximum depth of assessment. The material was described as "dry", and "loose", for the length of the borehole, suggesting no surface water or groundwater was present at the Site (North Shore, 2017b).

The stratigraphy at the wellbore APEC was shown in 5 boreholes 17BH01, 17BH02, 17BH03, 17BH04, and 17BH05. Stratigraphy was described as poorly-graded gravel with sand, to 4.5mbg, the maximum depth of assessment.

In boreholes along the southeast boundaries of the Site, 17BH18, 17BH20, and 17BH21, the stratigraphy was described as sandy loam to 0.2mbg overlying heavy clay with gravel to 3.0 mbg, the maximum depth of assessment.

Hydrogeology

Seven soil samples collected at varying depths from the background boreholes, were analyzed for grain size analysis, by sieve pan. The sieve method provides the percentage split between coarse and fine-grained material based on retention on a 75µm mesh screen sieve. The grain size analysis results ranged from 78% to 85% retention on the sieve, indicating coarse-grained material was dominant at the Site (North Shore, 2017b).

The shallow subsurface regional geology of the area north of Maxhamish Lake was reviewed through borehole logs from Phase 2 ESAs completed at four sites in the region. The borehole logs from the following sites were reviewed:

- PARA ET AL MAXHAMISH B- 21-K/094-O-14 (WA#03717) (North Shore, 2017c)
- PARA ET AL MAXHAMISH B- 043-K/094-O-14 (WA#12563) (North Shore, 2017d)
- PARA ET AL MAXHAMISH B- 083-K/094-O-14 (WA#13773) (North Shore, 2017e)
- PARA ET AL MAXHAMISH A-96-J/094-O-14 (WA#13772) (North Shore, 2017f)

The sites were located respectively approximately 19 kilometres (km) south-southeast, 16.6km south-southeast, 13.1km south-southeast, and 15.3km southeast of the I-46 Site. Soil stratigraphy at the b-21-K/94-O-14 site was topsoil and silty-clay overlying clay subsurface. Delineation boreholes around the site showed clay overlying hard clay, with minor occurrences of sandy loam. Hydraulic conductivity testing was completed at the site from 3 groundwater monitoring wells installed during the Phase 2 ESA: hydraulic conductivity values ranged from $1.0x10^{-9}$ meters per second (m/s) to $2.0x10^{-10}$ m/s, as expected from the soil type at the site (2017c).

The soil profile at background locations at the b-043-K site showed loam surface soil to 0.2m, overlying clay-loam soil to approximately 3.0mbg, followed by silty-clay-loam to 4.5mbg, and silty-loam to 6.0mbg. All samples from various depths submitted for grain-size analysis through sieve analysis showed fine-grained soils dominant in the soil profile at the site (North Shore, 2017d).

The borehole logs from background locations at the b-083-K and A-96-J sites showed consistent profiles with loam surface soil to 0.2mbg, followed by clay to approximately 3.0 mbg, overlying “hard clay” to 6.0mbg, the maximum depth of investigation; a layer of silty-clay was noted in one borehole from the a-069-J site. A sand layer was noted in one borehole from 2.4-2.8 mbg at the b-083-K site. All samples submitted for grain-size analysis through sieve analysis from both sites showed fine-grained soils dominant in the soil profile at the sites (North Shore, 2017e,f). Copies of the reviewed borehole logs and figures are provided in Appendix I and II.

From the Phase 2 ESA for the Site and hydraulic conductivity information the region, there was a sufficient minimum confining layer present between the Site and a deeper regional aquifer. Hydraulic conductivity values of the deeper soils at the Site would be expected to be low due to the hard clay soil at the Site. Therefore, drinking water (DW) standards would not apply at the Site within the shallow soils, but would apply in the deeper aquifer unit, if present. At the time of the assessments there were no water wells or residences within 500m of the Site.

5. ENVIRONMENTAL REGULATORY FRAMEWORK

Numerical soil standards for evaluating the results of the Phase 2 ESA were based on the CCME 2018 *Canadian Environmental Soil Quality Guidelines* (the CESQ), and the Northwest Territories *Environmental Guidelines for Contaminated Site Remediation* (the Environmental Guidelines) (Minister of the Environment and Natural Resources [ENR], 2003). The selection of applicable guideline limits in both documents are dependent upon site conditions, applicable receptors at a site, and relevant exposure pathways. From the land use definitions and soil depth considerations in the guideline documents, the Residential/Parkland land use was used to evaluate the 2017 Phase 2 ESA results for the Site.

For assessment of the available data for the I-46 Site, the *Tier 1 – Criteria-based Approach* described in the Environmental Guidelines and the CESQ guidelines were used to determine the applicable arsenic concentration limits for the Site.

For the evaluation of receptors and pathways related to groundwater protection, water use considered proximity to potable water and aquatic receptors, current and potential future use of groundwater aquifers as water sources, and the potential for groundwater extraction based on the hydraulic conductivity of the shallow regional soils. From the Site information in Section 2, there were no groundwater wells, water bodies, or residences within 500m of the Site. Based on the rationale in Section 4 regarding low hydraulic conductivity due to fine-grained soil in the region, and the lack of water bodies, water wells or residences in proximity to the Site, the Protection of Potable Groundwater, Protection of Freshwater Aquatic Life, and Protection of Livestock Watering pathways would not be operative at the Site.

The following receptor pathways were determined to be applicable at the Site:

For analytical results from soil samples <1.5mbg:	For analytical results from soil samples >1.5mbg:
• Direct Contact; and • Ecological Soil Contact.	• Ecological Soil Contact; • Nutrient and Energy Cycling check.

6. COMPARISON OF DATA

Based on the 2017 Phase 2 ESA, soil analytical results were compared to the applicable guideline limits with respect to the operative receptor pathways at the Site. Table C shows the historic Site soil data and various applicable soil guidelines for arsenic in soil at the Site:

TABLE C: Soil Quality Guidelines Applicable at the Site (mg/kg)

Parameter	Analytical Results	ENR 2003 Residential	CCME 1997*	CCME 1991 Residential	CCME 1991 Industrial	ENR 2003**
Arsenic	15.4 – 42.7	12	12	30	50	160

*All land uses
**Yellowknife and area soils (ENR, 2003)

Further discussion regarding the applicability of various guidelines with respect to expected land uses, available receptors, and site-specific conditions is included in the next section.

7. RESULTS AND CONCLUSIONS

Exceedances for arsenic were noted in surface and subsurface samples from the Well center at the Site. Analytical soil data from the 2017 North Shore Phase 2 ESA were compared to the current ENR and CCME guidelines applicable to the Site. A discussion of the results is presented below.

7.1 Soil Results

7.1.1 Arsenic

The CCME Residential/Parkland guideline for Arsenic in soils was based on protection of human health from soil ingestion with a limit of 12mg/kg, and the protection of environmental health, with a soil contact limit of 19 mg/kg (CCME, 1997). The 1991 CCME interim guideline for arsenic was 50 mg/kg.

Referring to CCME fact sheets, *Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health*, the fate and behaviour for arsenic according to the site-specific conditions and application of standards is as follows:

- If there was a spill or release leading to the exceedances for arsenic at the Wellbore, contamination from other chemicals, including hydrocarbons, salinity, and metals would be expected. As no residual hydrocarbon, salinity, or metals parameters were indicated in the analytical results for the Well Center, it was unlikely that the elevated arsenic concentrations at the Well Center were the result of a spill or release.
- The Site is not currently occupied by humans and the Site is unlikely to be occupied by humans in the future. While the arsenic concentration in soil samples at the Wellbore were above the guideline limit for soil ingestion and soil contact, the depth of the impacts at >0.8mbg was below the rooting depth for plants, and at a depth that would require mechanical excavation to expose impacted soil. Therefore, soil ingestion and soil contact pathways would not be operative at the Site.
- ENR Guidelines for soil in and around the Yellowknife area noted natural occurrences of arsenic up to 300mg/kg, with the average in and around the Yellowknife area of 150mg/kg (ENR, 2003). The ENR determined a remediation objective of 160mg/kg for Residential land use in Yellowknife area soils, based on accessibility (soil ingestion and soil contact) to the yard for 2 hours per day, 5 months of the year (ENR, 2003). Access to the subject Site by the public is currently less than 5 months of the year for a maximum concentration of 42.7 mg/kg in soil. The Site is in a remote

setting where access is limited to helicopter transport or winter roads, and toddlers or the public are not expected on a regular basis at the Site. The Site aligns with Industrial land uses, in contrast to the models for residential/parkland areas.

- The mobility of arsenic is dependent mainly on the pH of the soil at the Site. For all soil samples, the pH at the Site was low, ranging from 4.1 to 6.0 in the background samples, and ranged from 4.0 to 5.6 in the exploratory boreholes. The boreholes were noted to be dry sand, therefore under mainly aerobic conditions at the surface. The BC Ministry of environment and Climate Change Strategy's *Protocol 2 for Contaminated Sites: Site-Specific Soil Standards* indicate the at the infiltration rate of surface water is lowest in the northeast of BC, at 0.08m per year of water (MECCS, 2017). Under low pH conditions, silicate minerals acquire a positive charge, and are available for adsorption of arsenic anions present in solution. While leaching is increased in sandy soil, leaching is inversely proportional to the amount of adsorption sites available. Under low pH aerobic conditions with low rates of infiltration, arsenic will tend to stay adsorbed to soil minerals, and leaching from soil will be minimized (CCME, 1997).
- If removal of the elevated arsenic exceedance at the Wellbore was undertaken, the heavy equipment used to excavate the soil would likely cause significant impacts to the reclaimed condition at the Site compared to the minimal risk to humans and the environment that may be imposed by the arsenic remaining *in-situ*.
- The arsenic data was reviewed to determine if there were any significant statistical outliers. The outlier test is another method to determine whether all of the arsenic concentrations belong to one population representing natural background soil quality. If there was anthropogenic arsenic present, outliers in the data set would be expected. Using the data in Table I, there were seventeen samples submitted from the Site. The quartiles were: Q1 = 4.75 µg/g, Q2 = 15.7 µg/g and Q3 = 27.9 µg/g; the Inter-Quartile Range (IQR) was 22.25 µg/g. Outliers were defined by any value that lies outside of the lower range as calculated by Q1–1.5xIQR and the upper range as calculated Q3+1.5xIQR, shown below.

-28.6 µg/g = (Q1 – 1.5 x IQR) ←→**61.3 µg/g** = (Q3 + 1.5 x IQR)

The highest reported arsenic concentration at the Site of 42.7 µg/g is within the lower and upper quartile ranges.

TABLE D: Arsenic Concentrations at the Site

Sample ID	Depth (m)	Arsenic (µg/g)
17C01	0.8-1.0	2.8
17C01	2.2-2.5	6.2
17C01	4.3-4.5	3.5
17C01	0.8-1.0	3.4
17C01	1.3-1.5	2.1
17C01	2.8-3.0	6.0
17BH01	0.8-1.0	42.7
17BH01	2.2-2.5	26.8
17BH01	4.3-4.5	10.9
17BH02	0.8-1.0	30.3
17BH02	2.2-2.5	18.2
17BH03	0.8-1.0	15.4
17BH03	2.2-2.5	15.7
17BH04	0.8-1.0	25.5
17BH04	2.2-2.5	29
17BH05	0.8-1.0	31.2
17BH05	2.2-2.5	17.9

Based on the above rationale, the arsenic exceedances detected at the Well Center at the Site did not pose a risk to human and ecological receptors at the Site.

7.2 Conclusions

Based on a review of results from the 2017 Stage 2 PSI at the Site, SynergyAspen determined that the single arsenic exceedance at the Site was reasonably expected to pose no risk to receptors at the Site. Rationale for the determination was based on the depth of the samples; the lack of associated contaminant impacts; low pH and aerobic site conditions; low soil infiltration rates; lack of access by the public on a regular basis; and the increased disruption to a reclaimed site. The rationale regarding arsenic exceedances at the Site were considered to meet the ENR and CCME requirements for determining the risk to receptors at the Site.

8. CLOSURE

Based on the evaluation of the available historic data, no further environmental work is required at the Site prior to submission of the report to the ENR.

Thank you for the opportunity to conduct the work presented herein. If you have any questions or comments, please do not hesitate to contact the undersigned at 250-785-1030.

Respectfully Submitted,

SYNERGYASPEN ENVIRONMENTAL INC.

10. USER RELIANCE AND GENERAL LIMITATIONS

10.1 User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited (the Client). The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

10.2 General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions, and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY: R.G. BLACKALL O.L.S.
JUNE, 1999

LEGEND

All coordinates are computed for Zone 10, central meridian 123° W. Bearings were derived from the azimuths 89° 31' 05" computed between C.L.S. '77 Marker Control Monuments 1-46-1 and Area 001'10", 123°15' and 1-46-2 Grid Area 60° 10', 123° 15' and are referred to the Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in brackets are measured distances reduced to the horizontal at ground level.
For the computation of coordinates measured distances have been reduced to the sea level by multiplying them by an average combined scale factor of 0.9996316. Coordinates were then adjusted to the control.
Distances shown on grid are subdivisions are UTM plane.
Surveyed control monuments found
Monuments placed
Set 20mSS metal marker post 1.20m long placed 0.60m in [illegible] were placed over Geodetic or Control Monument
Radial Dist. = 104.21m

Survey was completed prior to drilling. Therefore well as drilled may not necessarily agree with proposed location

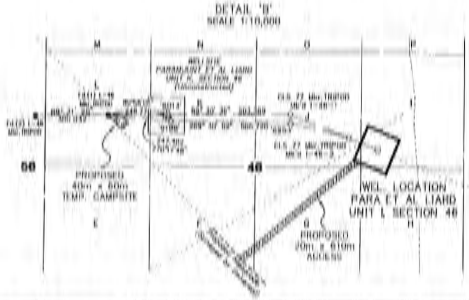
I, R.G. Blackall, of the City of Fort St. John, British Columbia, Canada Land Surveyor, make oath and say that I have in my own proper person, according to law and the best evidence of the Surveyor General of Canada Lands, performed the survey, preparing the survey plans by me and that notes and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

Sworn before me at Fort St. John, this 16th day of July, 1999

R.G. Blackall O.L.S.

A Notary Public in and for the Province of British Columbia

DETAIL 'B'
SCALE 1:10,000



All coordinates shown are on 1927 North American Datum.
They are based on values for found Geodetic Monuments recovered 1-46 Grid Area 60° 10', 123°15' and 1-46-1 Grid Area 60° 10', 123° 15'

Calgary, Alberta T2P 5C5

INTRODUCTION

Paramount Resources Ltd. (Paramount) retained North Shore Environmental Consultants Inc. (North Shore) to conduct a Phase 1 Environmental Site Assessment (ESA) for the Para et al Fort Liard N-01 gas well located in the Northwest Territories (NWT) at Unit N, Section 01 Grid Area 60° 10', 123° 15' (Site).

The purpose of the Phase 1 ESA was to assess and qualify potential environmental concerns associated with the Site through a historic records review and site visit. The Phase 1 ESA was conducted in general accordance with the Canadian Standards Association (CSA) *Standard Z678-01: Phase I Environmental Site Assessment* (CSA, 2001). The Alberta Energy Regulator (AER) *Assessing Drilling Waste Disposal Areas: Compliance Option for Reclamation Certification* (AER, 2014) guidelines were used to assess the drilling waste associated with the Site.

FINDINGS

The Para et al Fort Liard N-01 well was spud on December 12, 2000 and the rig was released on January 16, 2001. The well was drilled to a final depth of 1940 metres. The well produced sweet natural gas, condensate and produced water from 2001 to 2005. The well was deactivated in April 2008. The wellsite is accessible by helicopter and winter road.

Infrastructure identified in association with the site includes the following: wellhead, flare knockout tank with dual vent stacks, bermed methanol tanks, separator building, line heater, aboveground piping, pipeline riser, pig launcher, triethylene glycol (TEG) unit, meter skids, and a fuel tank. A 30 m x 60 m campsite and a 40 m x 60 m borrow pit were surveyed in association with the wellsite.

Aerial photograph imagery of the wellsite from 2011 and 2013 was reviewed and show production facilities located at the well centre and northwest and northeast of well centre. The subsided sump was also evident on the east side of well centre.

Drilling Waste Information

The well was drilled using a gel-chem drilling mud. According to the Alpine Environmental Ltd. Drilling Waste Sampling Report, 1999 m^3 of drilling waste was disposed of on site by mix-bury-cover. The sump was located on the east side of well centre. A Compliance Option 1 checklist and associated calculations were completed as per the *Assessing Drilling Waste Disposal Areas: Compliance Options for Reclamation Certification* document (AER, 2014). The drilling waste meets the requirements of the checklist and associated calculations and no further assessment of the drilling waste disposal area is required.

Spills & Complaints

A review of the NWT Resource Wildlife and Economic Development's Hazardous Material Spill Database identified the following spills associated with the N-01 wellsite:

Spill No.	Date	Spill Location	Product Released	Volume	Source
2007318	July 3, 2007	N-01 Wellsite	Methanol	135 L	Drum
2006322	August 16, 2006	N-01 Wellsite	Produced Water	150 L	Pipeline

Previous Assessments/Reports

The Alpine Environmental (Alpine) Annual 2005 Environmental Site Assessment Report indicated that an area of hydrocarbon impact was noted on the northeast area of the site and at well centre. A subsided area northeast of the vent stacks and at the former DWDA were holding water. Two trenches in the northwest area of the site were open and holding water, and wooden planks were noted south of the wellhead. According to previous sampling reports, hydrocarbon impacts were reported northeast of well centre as a result of a condensate spill; impacts were delineated vertically and extended off the site boundaries to the northeast.

A 2007 Inspection report indicated that the fuel drum on site had ruptured, and as a result, vegetation growth west of well centre was reduced. Housekeeping issues such as debris on site were also noted.

A limited Phase 2 ESA was conducted to delineate the methanol spills from 2007. An estimated 4 m^3 of impacted soil was present on site. A copy of the limited Phase 2 ESA report was not available for review.

A Paramount Remediation Summary document indicated that a biopile was constructed in March 2007 to remediate soil impacted from 150 L of produced water that was carried over from the vent stacks in August 2006. The biopile was sampled on August 14, 2007 and reported benzene, ethylbenzene, toluene and petroleum hydrocarbon F3 values that exceeded applicable guidelines.

From January 8 through 11, 2008, the soil in the biopile was mixed and soil from two areas, one located on the southwest corner and the other on the northeast portion of the berm, were excavated and added to the biopile. Composite samples were taken and benzene and ethylbenzene exceedences were reported. In March 2009, the biopile was turned and separated into two windrows. The document also noted that two samples were collected from the 2007 methanol spill area to further delineate the impacts. Further information regarding the biopile and the methanol spill area sampling was not available for review.

A 2008 Groundwater Monitoring Report noted that annual assessments and/or monitoring had been completed at the site from 2002 to 2008. In 2004, Alpine installed three groundwater monitoring wells, and in 2005, an additional two monitoring wells were installed. Seven groundwater monitoring and sampling events were completed between March 2004 and August 2007. Historically, salinity, metals and hydrocarbon values exceeding applicable guidelines have been reported in soil samples collected from the site. In August 2008, the concentrations of petroleum hydrocarbons in all groundwater samples were below the drinking water criteria. Total dissolved solids criterion was exceeded in all monitoring wells. All wells had dissolved manganese concentrations above the drinking water criterion. Monitoring well BH106 had dissolved zinc concentrations exceeding the freshwater aquatic life criterion. Copies of assessment and monitoring reports prior to 2008 were not

available for review. Based on 2007 and 2008 groundwater sampling results, Paramount recommended to the National Energy Board that the frequency of the monitoring and sampling events be decreased to bi-annual or tri-annual.

Interviews

There were no Paramount operations personnel with historic knowledge of drilling or production activities at the Site available for an interview.

Site Visit

During the February 2017 site visit, North Shore noted subsided areas southeast and northeast of well centre. An excavated remedial area was noted on the northeast portion of the wellsite, and a drainage ditch was noted on the northwest area of the site. The centre of the site was padded and the organics appeared to have been stripped. Dogwood, willow, fescue, moss, spruce, tamarack and sweet clover were noted on site. Two 400 barrel aboveground storage tanks (AST) in containment were noted on the northwest area of the site and one AST was noted south of the separator. Two flare lines extending from well centre to the northeast portion of the site were noted, as well as aboveground pipelines extending from well centre to various facilities. Two flare stacks were noted o the northeast area of the site, and a group separator, a separator, an incinerator, and three meter buildings were noted. The site was under snow cover at the time of the assessment.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information gathered for this Phase 1 ESA from the historic records review and the site inspection, North Shore concludes that there is a potential for environmental impact in connection with the site. A Phase 2 ESA is recommended to assess the following areas of potential concern:

- Well centre;
- Production facility areas;
- Flare stack/flare knockout drum areas;
- Area of reported soil impacts on the northeast area of the site; and
- Reported spill areas.

DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

In the preparation of this report, selected Alberta Energy Regulator (AER) reference material has been gathered from AbaData™ (property of Abacus Datagraphics Ltd.), which is an online information source. The information provided by AbaData is received directly from the AER, electronically updated on a monthly basis and is assumed to be correct.

CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

LEGEND

UTM coordinates are computed for Zone 10 Bearings were derived from the bearing 13° 42' 31" computed between Fd. CLS 77, Post C-02-2 and Wellcentre Spike for Wellsite C-02, and are referred to meridian 123° W.

Distances are expressed in metres and decimals thereof.

Distances shown in traverse are measured distances reduced to the horizontal at general ground level..

For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995227.

Distances shown on grid area subdivisions are UTM plane.

Control monuments found ..... ●
Monuments placed ..... ○

Mkr. denotes metal marker post 2.0m long placed 0.30m away from Post.

Elevations were derived from Geodetic Survey of Canada Monument 'Fort Liard' Elev. = 216.299 m.

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

All coordinates shown are on 1927 North American Datum. Coordinates were derived from Fd. CLS Post C-02-2 and Fd. Wellcentre spike from Wellsite Plan Para et al Liard Unit C, Sec. 02, Grid Area 60° 10', 123° 15'.

Certified Correct and completed on the 14th day of June, 2000.

Subject: RE: Looking for Production Information

Brent,

I have included a table below that shows the annual production statistics gathered by the NEB for the Fort Liard fields.

There are four fields:

- Liard Wells: Liard F-25A, K-29, M-25, 2K29, 3K-29, 2M-25, K29A
- Liard North Wells: North Liard P-66A
- Fort Liard SE Wells: SE Fort Liard N-01
- Fort Liard Wells: Fort Liard F-36, O-35

There is monthly data by well, but it would take me a while to compile the historical records for release. Please let me know if this information suits your purpose, and feel free to call if you have any questions.

Thanks Kristen. If there are any issues sending the information via email let me know and we could send it through North Shore's FTP site.

Thanks,

Brent

Brent,

Thanks for sending the specifics. If the information is readily available, we may have it in a few days, but it can sometimes take a couple of weeks if it has been archived.

In the meantime, I have found production reports for 2005 and 2006. I will see what information I can send you from those reports.

Subject: RE: Looking for Production Information

Hi Kristen,

Thank you for the quick response. The production records that we are looking for are from the early 2000's. Specifically, we are looking for information for the Paramount Resources wells O-35, N-01, I-46, F-36, and A-01. From the information we currently have it looks like these wells produced between 2002 and 2007. I believe there will only be production information for F-36, O-35, and N-01. The other two wells were drilled and abandoned.

Would you be able to see if there are production records for these wells?

Thanks,

Brent

Subject: RE: Looking for Production Information

Hello, Brent,

Thank you for contacting OROGO. As of April 2014, the Regulator has jurisdiction for the regulation of oil and gas works and activities in the onshore Northwest Territories (NWT), with the exception of the Inuvialuit Settlement Region and lands that were not transferred from the Government of Canada to the Government of the Northwest Territories.

Production statistics by field for 2014, 2015, and 2016 are available on our website at www.orogo.gov.nt.ca on the 'Documents' page. The files are listed alphabetically. *Production Statistic Reports* are on page 3, and there is one document for each year. However, all production since 2014 has been from the Cameron Hills field. There has been no recent production in the Fort Liard area. If you need historical production data, let me know and I will see if we can obtain it.

Please feel free to call me if you have any questions.

Subject: Looking for Production Information

Hi Kristen,

North Shore is currently completing Phase 1 ESAs for some wellsites in the Fort Liard area. We are relatively new to working in the Northwest Territories and we are trying to track down production information for the wells. Would this information be available in the OROGO Public Registry? Any help or information that you can provide would be greatly appreciated.

Thanks,

Brent

DRILLING WASTE SAMPLING REPORT

PROJECT NO: N0009 **TICKET NO:** 1010 **DATE:** January 19, 2001

COMPANY NAME: Paramount Resources Ltd.
LEGAL DESCRIPTION: "LIARD" N-01
LOCATION OF SUMP: On-site
CONDITION OF ACCESS: Winter access
SAMPLED BY (Individuals): D. Sahara & R. Hennessey

	PIT A		
OIL COVER (%)	100% light sheen		
FREEBOARD (m)	1.4		
TOTAL VOLUME OF SUMP (m^3)	1999		
TREATABLE FLUID VOLUME (m^3)	266		
SOLIDS VOLUME (m^3)	1236		
CUTTINGS VOLUME (m^3)	N/A		
ICE VOLUME (m^3)	497		

DESCRIPTION OF FLUID

At the time of sampling, the fluid was yellow in colour, non-turbid, and emitted no apparent odour.
A fluid sample was not procured, as the proposal disposal method is mix/bury/cover of the total waste component of Pit A.

PROJECT NO: N0009 **TICKET NO:** 1010 **DATE:** January 19, 2001

COMMENTS

The on-site soil texture consists of sandy clay. Pit A was excavated with a hoe. The northeast corner of Pit A is located 6 m west of the well centre. The south, east and west sides of the site are surrounded by muskeg.

SAMPLES OBTAINED

Pit A Total Waste (1-1L AW Jar, 1-2L HDPE Pail)

On-site Soil (1- bag)

Legend	AW: Acid Wash PE: Polyethylene HDPE: High Density Polyethylene

DIRECTIONS

From Fort Nelson travel 23 km west to the Liard Hwy. Turn right onto the Liard Hwy. and travel 122 km. Turn left and travel 8 km to the Paramount "Maxhamish" compressor station at d-36-I/94-0-14. Turn right and travel 12.2 km. Turn right and travel 7.2 km. Turn right and travel 0.3 km to the site.

South-west corner	0 m South	0 m West				

COMMENTS

Approximately 1999 m3 of Pit A Total Waste is satisfactory for disposal under mix/bury/cover criteria in the G-50 guidelines. A minimum mixing ratio of 1 part waste to 3 parts soil will ensure all parameters are within G-50 guidelines.

As a mud list was not available at the time of sampling, a microtox was completed to ensure no toxicity problems with the sampled waste.

Additional comments, disposal/treatment plan details, or site maps may be added on a separate page.

Compliance Option 1
Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement, an environmental site assessment must be conducted in accordance with Compliance Option Three. **If insufficient information is available to allow completion of the Compliance Option One checklist, Compliance Option Two or Three (Phase 2 ESA) must be completed.**

1. General Disposal and Drilling Fluid Information:
If some or all of the drilling waste was managed on-site (the wellsite) or at a land treatment area or a remote sump, then the checklist must be completed. In some cases, the drilling waste may have been managed at a remote sump/site that is not linked to the wellsite and as such a separate reclamation certificate is required for that separate location. If the remote sump or land treatment area is linked to the wellsite, proceed with the checklist for the remote sump or land treatment area. Where remote sumps are associated with multiple disposals managed in separate cells complete one checklist per disposal. Otherwise, complete one checklist by combining the information from all notification forms.

Section 1.0 to 1.3 must be completed for all disposals. The remaining sections do not need to be completed for wastes disposed of by the following methods:

a) If drilling waste was managed at an AER or ESRD approved waste management facility, indicate this using the appropriate checkbox below and list the supporting documentation (e.g. waste manifests, truck tickets, invoices, Alberta Oilfield Waste Management Form) under Reference Documents.

b) If the waste was disposed at an off-site location by pump-off, landspraying or landspray-while-drilling (LWD), or disposal onto forested public lands and the *Notification of Drilling Waste Disposal Form*, *Drilling Waste Management Disposal Form*, *Drilling Waste Pipeline Disposal Form,* or equivalent indicates the disposal method and location.

The notification form will indicate the type of drilling fluid system used. Water-based drilling fluids can be described in numerous ways for example; gel chem, floc water, fresh water gel, gypsum water, nitrate gypsum water, etc.

1.0 Well Information:	Unique Identifier (UI)	Para et al Fort Liard N-01
	Spud Date	December 12, 2000
	Well Depth	1940 m

1.1 Disposal Method (Check all that apply):

On-site
- ☒ Mix-bury-cover
- ☐ Landspread
- ☐ Biodegradation, including land treatment
- ☐ Landspray-while-drilling
- ☐ Landspray
- ☐ Pump-off
- ☐ Disposal onto Forested Public Lands

Off-site
- ☐ Landspray-while-drilling
- ☐ Landspray
- ☐ Pump-off
- ☐ Disposal onto Forested Public Lands

- ☐ Land Fill/Waste Management Facility

Remote Sump/Site
- ☐ Mix-bury-cover
- ☐ Landspread
- ☐ Biodegradation, including land treatment
- ☐ Landspray-while-drilling
- ☐ Pump-off
- ☐ Landspray
- ☐ Disposal onto Forested Public Lands

☐ Other, specify: _____

	Yes	No
1.2 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☐	☒
If yes, were the disposal areas separate from one another?	☐ Drilling waste information must be evaluated for each disposal	☐
If the disposal areas were not separate, is documentation available to show that a disposal plan was followed that was agreed to by the licensee and the regulator?	☐ Disposal plan and confirmatory information must be retained on file and provided to the AER upon request.	☐ Compliance Option Two or Three required
1.3 Were cuttings or solids disposed of on-site that were associated with off-site waste disposal?	☐	☒
If Yes, is separate analytical information or unique notification available?	☐	☐
If separate information or notification is not available, is the known volume (include references in Reference Documents) or estimated volume of waste disposed of on-site less than 50 m^3?	☐	☐ Phase 2 required
If the volume of cuttings or solids disposed of on-site is unknown, estimate the volume using following calculation and enter the data and results at right*: $V_C = V_T - V_{OFF}$ Where: V_C = Volume of cuttings or solids on-site (m^3) V_{OFF} = Volume of cuttings or solids disposed of off-site (m^3) V_T = Total volume of cuttings or solids (m^3) and: $V_T = \left(\frac{WDm}{2000}\right)^2 \times 3.14 \times WDp \times 1.2$ Where: WDm = Well diameter (mm) WDp = Well Depth (m) * If different hole sections have different diameters, V_C may be calculated for each section separately. Provide the data and result for each section at right or as an attachment.	Enter data below: V_C = ____(m) V_T = ____(m) V_{OFF}= ____(m^3) WDm = ____(mm) WDp = ____(m)	

	Yes	No
1.4 Were water-based drilling fluids used (gel chemical drilling fluid system)?	☒	☐
If Yes, were all or part of the wastes disposed of on-site?	☒	☐
1.5 Was the drilling fluid described as an advanced gel chemical system?	☐	☒
If Yes, were all or part of the wastes disposed of on-site before November 1, 2012?	☐	☐
If wastes were disposed of on-site before November 1, 2012, was the disposal done in compliance with an approval from the AER?	☐ Approval and post-disposal sampling results must be retained on file and provided to the AER upon request.	☐ Compliance Option Two or Three Required
1.6 Is a mud list available and can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒	☐ Phase 2 required
1.7 For mix-bury-cover disposal, was the disposal completed before November 1, 2012?	☒	☐
If Yes, was calculated or measured post-disposal chloride concentration 800 mg/kg or less?	☒	☐ Phase 2 required
1.8 For mix-bury-cover or landspread disposal, was the disposal completed on or after November 1, 2012?	☐	☒
If yes, did electrical conductivity, nitrogen concentration or sodium loading rate trigger a requirement for post-disposal sampling?	☐	☐
If post-disposal sampling was required, did all post-disposal samples meet the soil endpoints specified in Section 3 of *Directive 50* (2012 version).	☐	☐ Phase 2 required

	Yes	No
1.9 Was a remote site used?	☐	☒
If Yes, is the remote site included in this reclamation application?	☐	☐
If not included, is the remote site a multi-well disposal location?	☐ In Comments section, indicate which well the remote site will be linked with for the purposes of reclamation	☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.10 Were cement returns buried on-site or at a remote site linked to the well?	☐	☒

2. Hydrocarbon & Toxicity Management

If hydrocarbon based drilling fluids were used (i.e. diesel inverts, synthetic or mineral oil systems) or hydrocarbons were added to the drilling fluid or the well is a horizontal oil well then it must be demonstrated that the resulting drilling waste was handled appropriately as per *Directive 50* or *Directive 58*. In most cases, if hydrocarbons were added to the system or if the well was a horizontal oil well it is still possible to dispose of the resulting drilling waste on the location and remain within allowable disposal limits but hydrocarbon testing and toxicity testing must have been conducted and documented.

	Yes	No
2.1 Were hydrocarbon-based drilling fluids used or were hydrocarbons added to the drilling fluid or was the well a horizontal oil well?	☐	☒
If Yes, is documentation available showing that the wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58*?	☐	☐ Phase 2 required

	Yes	No
2.2 For mix-bury-cover or landspread disposal, was the disposal completed before November 1, 2012 and was hydrocarbon present?	☐	☒
If yes to both, is the predicted post-disposal hydrocarbon concentration at or below the appropriate guideline? (subsoil: 0.1%, topsoil: 0.5%)?	☐	☐ Phase 2 required
2.3 For mix-bury-cover or landspread disposal, was the disposal completed on or after November 1, 2012?	☐	☒
If yes, did hydrocarbon concentrations in the waste trigger a requirement for post-disposal sampling?	☐	☐
If post-disposal sampling was required, did all post-disposal samples meet the soil endpoints specified in Section 3 of *Directive 50* (2012 version).	☐	☐ Phase 2 required
2.4 Was a luminescent bacteria toxicity (Microtox) test required?	☒	☐
If Yes, did the waste pass the toxicity test requirements as outlined in *Directive 50* (waste must pass either the original or charcoal toxicity test)?	☒	☐
If the waste failed the toxicity test (i.e., EC50 (15) original and EC50 (15) charcoal treated, reading at 15 minutes < 75%) is there evidence that demonstrates the waste was treated to remove toxicity and retested or disposed of as per *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

3. Metals (Trace Elements) Management

Some drilling fluids contain trace metals and other toxic compounds. Metal-containing additives that have been or are being used include barite ($BaSO_4$), zinc carbonate ($ZnCO_3$), and chrome-based thinners. If these additives were used, the attached calculation tables must be completed and the results used to determine if a Phase 2 ESA is required.

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid?	☒	☐
If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ Show calculation on attached form	☐ Phase 2 required
3.3 Was zinc carbonate added to the drilling fluid?	☐	☒
If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ Show calculation on attached form	☐ Phase 2 required (Cadmium analysis will also be required.)
3.4 Were chrome-based thinners added to the drilling fluid?	☒	☐
If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ Show calculation on attached form	☐ Phase 2 required
3.5 Were any other metals added that triggered testing required by Section 3 or 5 of *Directive 50* (1996 version)?	☐	☒
If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available?	☐	☐ Phase 2 required
If above data are available, did the application rate or maximum application meet *Directive 50* (1996 version) requirements?	☐	☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling?	☐	☐
If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐	☐ Phase 2 required

Mud Additives (Attach additional pages if necessary.)

Product Name	Amount Used	Brief Description of Product
Gel	449 sacks	Viscosifier
Caustic	24 sacks	Alkalinity pH control
Detergent	20 L	Surface Active Agent
Sawdust	36 sacks	Lost Circulation Material
Floc	24 sacks	Flocculant
Gypsum	46 sacks	Shale Control Inhibitor
Alcomer	1 pail	Thinner, Dispersant
Barite	273 sacks	Weighting Material
Soda Ash	6 sacks	Calcium remover
Ligco	10 sacks	Thinner, Dispersant
Staflo	5 sacks	Filtrate Reducer
Desco	1 sack	Thinner, Dispersant (contains chrome)

Daily Drilling Reports
Paramount Well File
Alpine Environmental Drilling Waste Sampling Report

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

A Notification of Drilling Waste Disposal document was available for review and indicated that 1999 m^3 of gel-chem drilling waste was disposed of in an onsite drilling waste disposal area (DWDA) by mix-bury-cover. The DWDA was located on the east side of well centre.

The drilling waste meets the requirements of the Compliance Option 1 checklist and barite and chrome-based thinner calculation criteria. Further assessment of the DWDA is not required.

Location: Para et al Fort Liard N-01 **Spud:** December 12, 2000

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50* , *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre
273	÷	1940	÷	3	=	0.05

Result
PASS

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Location: Para et al Fort Liard N-01 **Spud:** December 12, 2000

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre
1	÷	1940	÷	3	=	0.0002

Result
PASS

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Phase 2 Environmental Site Assessment

North Shore Environmental Consultants Inc. is pleased to submit our Phase 2 Environmental Site Assessment report for the N-01 (60°10', 123°15') wellsite to Paramount Resources Ltd.

North Shore appreciated the opportunity to work on this project and if we can provide clarification of any part of this report, please call the undersigned at (780) 467-3354.

Yours truly,

North Shore Environmental Consultants Inc.

Phase 2 Environmental Site Assessment
May 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the N-01 (60°10', 123°15') wellsite (Site) located near Fort Liard, NWT. The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017. Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the federal and provincial remediation guidelines. The areas of potential environmental concern included the following:

- Well centre;
- Former methanol spill area;
- Production facility area;
- Flare area; and
- Potential flare pit area.

Between February 4, 2017 and February 5, 2017, 29 drilling (solid-stem) boreholes and one hand auger borehole were advanced at the Site. Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

1 INTRODUCTION

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the N-01 (60°10', 123°15') wellsite (Site) located near Fort Liard, Northwest Territories (NWT).

1.1 Objective

The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017 (North Shore, 2017). Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines.

1.2 Scope of Work

The scope of work for the Phase 2 ESA included the following:

- Review background information to assist with establishing site specific protocols.
- Obtain the necessary written agreements from third-party licensees in the area.
- Hire a private utility locating surrounding the proposed ground disturbance locations in the proposed work area and control area (30 meter (m) buffer around the work area).
- Conduct a tailgate safety meeting prior to initiating work each day at the Site. This includes North Shore personnel and any other contractors' onsite.
- Advance 30 borehole locations to investigate background soil conditions and areas of potential environmental concern identified in the Phase 1 ESA (North Shore, 2017).
- Collect samples from each borehole, field screen, and log according to Canadian System of Soil Classification.
- Submit selected soil samples for laboratory analysis to confirm the absence or identify the presence of oil and gas related impacts.
- Prepare a report documenting the findings of the Phase 2 ESA and compare laboratory results with applicable soil remediation guidelines.

2 BACKGROUND

2.1 Site Description

The Site is located at Unit N, Section 1 Grid Area 60°10', 123°15' approximately 80 kilometres (km) south east of Fort Liard, NWT. The Site is located approximately 4 km north of the NWT/British Columbia (BC) border. A location map of the Site is included as Figure 1 and a survey plan is included in Appendix A.

2.2 Land Use and Receptors

The lease is situated on Crown land in a mixed-wood forested area. The Site has not been reclaimed, but natural encroachment from the surrounding forest is evident throughout the lease. Site photographs are included as Appendix B.

2.3 Site History and Infrastructure

The Para et al Liard N-01 well was spud on December 12, 2000 and drilled until January 16, 2001 to a depth of 1940 metres (m). The well produced sweet natural gas, condensate and produced water between 2001 and 2005 before the site was deactivated by Paramount in April 2008. Fluids were transported from the site via pipeline to the Paramount Maxhamish d-36-I compressor station in BC.

Infrastructure identified in association with the site includes the following: wellhead, flare knockout tank with dual vent stacks, bermed methanol tanks, separator building, line heater, aboveground piping, pipeline riser, pig launcher, triethylene glycol (TEG) unit, meter skids, and a fuel tank. Infrastructure was still in place at the time of this assessment.

2.4 Previous Environmental Work

A Phase 1 ESA was completed by North Shore in March 2017 (North Shore, 2017). Facilities remained onsite at the time of the Phase I ESA site visit. Areas of potential of environmental concern that were recommended for investigation included:

- Well centre;
- Production facility areas;
- Flare stack area/flare knockout drum area;
- Area of reported soil impacts on the northeast area of the Site; and
- Reported spill areas.

3 METHODOLOGY

3.1 Safe Work Procedures

North Shore personnel adhered to Paramount's policies and procedures to complete the assessment and investigation program. Standard oilfield personal-protective equipment (hard hat, steel-toed boots, safety glasses, and fire retardant coveralls) were worn by all personnel on-site. A calibrated four way gas monitor for H2S, O2, CO, and organic vapours was also carried by each person participating in the field work. Nitrile gloves were worn when handling soil samples. All personnel onsite were required to possess copies of the applicable safety certification (Ground Disturbance Level 2, H2S Alive, Transportation of Dangerous Goods, Workplace Hazardous Material Information System, and Standard Level First Aid). North Shore personnel acquired a Paramount Safe Work Permit prior to commencing fieldwork and a tailgate safety meeting was conducted at the beginning of each work day.

Prior to initiating any ground disturbance, a file review was completed and the proposed assessment area was swept by a third party company for the presence of buried facilities.

All ground disturbance documentation was peer reviewed prior to commencing the fieldwork. A hydrovac was not used prior to drilling, all above ground infrastructure was still in place and boreholes were advanced 5 m from any underground facilities.

3.2 Drilling Program

3.2.1 Borehole Drilling

Between February 4 and 5, 2017, 30 boreholes (17C01 to 17C02, 17HA01 and 17BH01 to 17BH27) were advanced as part of the drilling program (Figures 3). Boreholes were completed using a tracked-mounted drilling rig equipped with 15 cm solid-stem. One borehole was advanced using a hand auger. Boreholes were completed to a maximum depth of 6.0 metres below ground level (mbgl), depending on the assessment location and subsurface conditions. Delineation of potentially impacted areas was based on field screening, visual cues, and professional judgment. Vertical and horizontal delineations were completed to determine the spatial extent of the potentially impacted material. If potentially impacted material was identified during borehole logging, vertical delineation was completed by sampling parameters above the suspected impact zone and to a depth of 1.0 m below the suspected lowest point of contamination. Horizontal delineation was completed by advancing boreholes in 5.0 m horizontal increments in each direction (north, south, east, and west) until clean material, as determined by field screening and professional judgment, was identified. Select delineation samples were collected for laboratory analyses.

The GPS location, reference from a fixed point, and rationale of each borehole is included in the borehole logs in Appendix C. Borehole locations are shown in Figure 2.

3.3 Soil Sampling

Throughout the sample collection process, North Shore adhered to sampling procedures described in the Canadian Council of Ministers of Environment (CCME) Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites (CCME, 1993). Samples of the recovered soil were visually inspected for evidence of impact such as free product, staining, or discoloration. The outermost layer of the samples was trimmed using a soil tool to avoid cross-contamination. North Shore personnel wore a pair of clean, chemical resistant nitrile gloves for each soil sample collected as an added preventative cross-contamination measure.

Soil vapor concentrations were field screened for volatile hydrocarbon constituents using an RKI Eagle gas detector (RKI Eagle), calibrated with a 400 parts per million (ppm) concentration of hexane gas with the methane elimination switch turned on. Samples selected for vapor screening were placed into plastic bags, sealed, agitated, and allowed to volatilize. Volatile organic compounds (VOCs) that accumulated within the headspace were then measured in ppm or percent of the lower explosive limit (LEL) and recorded on the borehole logs.

Soil samples were also field screened for salinity related parameters by measuring electrical conductivity (EC) using a Spectrum Technologies Inc. Field Scout Soil and Water EC Metre (EC Probe).

Prior to sampling, the EC probe was calibrated with a 2.76 dS/m calibration solution. Once the soil on the auger had been trimmed, the EC probe was inserted directly into the soil media in order to obtain an insitu EC reading. The EC reading was allowed to stabilize for three seconds before being recorded in the field documents.

All soil samples were placed in sealable plastic bags for field screening organic vapors and inorganic analyses. Soil samples for volatile organic analyses included field preservation with methanol and glass jars with Teflon-lined lids for all other organic analyses. Jarred samples were packed tightly to minimize headspace, help prevent the loss of VOCs, and minimize biodegradation. All samples collected were labeled and placed in a cooler with ice or ice packs to maintain a temperature as close to 4°C as possible. Soil samples were transported to an accredited laboratory for analysis. Standard chain of custody protocols were followed during the transport of the samples.

Soil characteristics at each borehole location were described using classification procedures and terminology from The Canadian System of Soil Classification (Soil Classification Working Group, 1998). Borehole logs containing the soil profile descriptions are included in Appendix C.

3.4 Quality Assurance and Quality Control

3.4.1 Laboratory QA/QC

Soil samples collected during the February 3 to February 4, 2017, sampling event were submitted to AGAT Laboratory (AGAT) in Calgary, Alberta for analysis. The analytical suite was selected based on regulated compounds that are typically found on oil and gas sites.

AGAT is a Standards Council of Canada (SCC), ISO 9000 Series and ISO/IEC 17025 accredited laboratory and Canadian Association of Environmental Analytical Laboratories (CAEAL) accredited laboratory that uses ESRD recognized methods to conduct laboratory analyses. Method blanks, control standards samples, Certified Reference Material (CRM) standards, method spikes, replicates, duplicates, and instrument blanks are routinely analyzed as part of the QA/QC program at the laboratory. AGAT has indicated that analytical data is only released if it passes the laboratory QA/QC procedures. A summary of the QA/QC procedures adopted by AGAT during the analyses of samples for petroleum hydrocarbon concentrations, salinity parameters, and metals concentrations is included in Appendix D.

4 COMPARISON GUIDELINES

4.1 Assessment Guidelines

Selection of the appropriate set of guidelines is based on the texture of the dominant soil type along with current and potential future land use as determined in the assessment. Where both fine and coarse grain strata are present, grain size is determined by the stratum governing horizontal and vertical migration to a receptor. Four soil samples collected from depths ranging from 1.3 to 4.5 mbgl were analyzed for particle size (75 micron sieve). All of the samples were reported to be fine-grained and the guidelines for fine-grained soils were applied.

As per the direction of Paramount, the guidelines for residential/parkland land use were applied to the Site and laboratory values were compared to the following:

- Soil regulated metals, glycol, benzene, toluene, ethylbenzene, and xylenes (BTEX), PHC fractions F1-F4 and polycyclic aromatic hydrocarbons (PAH) results were compared to the Canadian Council of Ministers of the Environment (CCME) - Tier 1 Soil Remediation Guidelines (CCME, 2017).
- Saturated paste boron and methanol results were compared to the AEP Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1 Guidelines; AEP, 2016a).
- Soil EC, Sodium Adsorption Ration (SAR) and pH values were compared to Environmental Guidelines for Contaminated Site Remediation (EGCSR, 2003) Environment Division. Government of the Northwest Territories (EGCSR, 2003).

4.2 Background Control Characterization and Salinity Guidelines

All control EC and SAR results complied with the EGCSR Guidelines with the exception of one EC value of 2.29 dS/m (primarily naturally occurring calcium sulphate). The onsite values were compared to the same general EC and SAR range. One control sample reported a pH value of 5.73 that did not meet the EGCSR Guidelines. This is an indication that the soils in the area may have EC values above the guideline range, and naturally low pH values. All other samples met the applicable remediation guidelines.

All of the control samples reported arsenic values ranging from 10.7 mg/kg to 16.8 mg/kg, which exceed the applicable remediation guideline. One nickle value of 49 mg/kg was reported in the control soil samples. This is an indication that naturally elevated arsenic, and nickel values may occur in the area. All other control samples reported metals values that met the applicable guidelines (Tables 2 and 3).

5 RESULTS OF FIELD INVESTIGATION

5.1 Stratigraphy

Based on the boreholes advanced during the drilling program, soil conditions generally consisted of organics to clay over clay loam to heavy clay.

5.2 Soil Results

Soil results for areas of concern are summarized in Sections 5.2.1 through 5.2.5. The laboratory analyses for soil samples are presented in Tables 1 through 5 along with the applicable comparison guidelines. A summary of the analytical testing procedures of the laboratory is presented on the laboratory certificates enclosed in Appendix D.

5.2.1 Well Centre Area

One borehole (17BH01) was drilled within the well centre area to a maximum depth of 6.0 mbgl. Disturbed soil was encountered to a depth of 1.5 mbgl. The Phase 2 ESA was completed prior to

abandonment, therefore the wellhead was still in place. Ground cover in the area was uniform and similar to the surrounding lease. VOC field screening results from the well centre samples were all less than 140 ppm. EC field screening results from well centre samples ranged from 0.54 to 1.71 dS/m.

Four samples were submitted for hydrocarbons, five samples for detailed salinity and metal analyses. One sample (17BH01 3.2-3.4 mbgl) exceeded applicable hydrocarbon guidelines for PHC F2 (382 mg/kg) and SAR (7.94). Two samples (17BH01 0.3-0.5 mbgl and 17BH01 0.8-1.0 mbgl) exceeded applicable pH and EC guidelines. One sample (17BH01 2.2-2.5) reported an EC value of 2.17 dS/m, which exceeds the applicable guideline, but is comparable to the reported control EC value. Sample 17BH01 (3.2-3.4 mbgl) exceeded total barium criteria, therefore extractable and fusion barium analyses were completed which indicated the barium meets the applicable true total fusion barium guideline. One sample (17BH01 0.8-1.0) reported a selenium value of 1.1 mg/kg, however when the appropriate significant digits are applied, the value meets the applicable guideline. The same sample reported a nickel value of 46.3 mg/kg, which exceeds the CCME Guideline, but is comparable to reported control Nickel values. All other analyzed parameters complied with the applicable guidelines.

Four delineation boreholes (17BH02 to 17BH05) were advanced around the periphery of the well centre area to a maximum depth of 4.5 mbgl. Four samples collected from the boreholes were analyzed for hydrocarbon, nickel, and detailed salinity parameters. Two of the samples reported EC values of 2.94 dS/m and 2.56 dS/m, which exceed the applicable guideline, but are comparable to reported control EC values. All other delineation samples reported values that met applicable guidelines, indicating both vertical and lateral delineation were achieved.

5.2.2 Former Methanol Spill Area

One borehole (17BH07) was drilled within former methanol spill area. The borehole was advanced to a depth of 3.0 mbgl. VOC measurements from the area were all less than 5 ppm. EC field screening results from soil-waste mixture samples ranged from 0.43 to 0.64 dS/m.

One sample (17BH07 0.8-1.0 mbgl) was submitted for petroleum hydrocarbon analysis, two samples (17BH07 0.0-0.2 mbgl and 17BH07 2.2-2.5 mbgl) were submitted for detailed salinity and metal analyses, and one sample (17BH7 0.0-0.2 mbgl) was submitted for glycols and methanol analysis. Both samples reported arsenic values of 16 mg/kg and 15.1 mg/kg, which exceed CCME Guidelines, but are comparable to reported control values. All other samples submitted for analysis met the applicable remediation guidelines.

5.2.3 Production Facilities Area

Twelve boreholes (17BH06, and 17BH08 to 17BH18) and one hand auger borehole (17HA01) were advanced within production facilities areas on the wellsite. Boreholes were advanced to a maximum depth of 3.0 mbgl. VOC measurements from the soil-waste mixture were all less than 110 ppm. EC field screening results from the area ranged from 0.11 to 0.99 dS/m.

Eleven samples were submitted for hydrocarbon analysis, fourteen samples were submitted for detailed salinity, ten samples were submitted for metal analyses, one sample was submitted for PAH

analysis, and nine samples were submitted for glycols and methanol analysis. Seven samples reported arsenic values ranging from 14.0 mg/kg to 25.4 mg/kg, which exceed CCME Guidelines but are comparable to reported control arsenic values. All other samples submitted for analysis met the applicable guidelines.

5.2.4 Flare Area

Five boreholes (17BH19 to17BH23) were advanced in the northeast corner of the wellsite in the flare area. Boreholes were advanced to a maximum depth of 3.0 mbgl to assess the flare stack/knockout drum area, areas of soil impacts were previously reported in the area, and a historical condensate spill and produced water spill. VOC measurements were all less than 20 ppm. EC field screening results from soil samples ranged from 0.12 to 0.57 dS/m.

Nine samples were submitted for hydrocarbon analysis, metals and detailed salinity analysis, and two samples were submitted for PAH analysis. One sample (17BH21 0.8-1.0 mbgl) exceeded the applicable guidelines for ethylbenzene (0.64 mg/kg). The identified exceedance was delineated vertically, but not laterally. Eight samples reported arsenic values ranging from 13.4 mg/kg to 16.6 mg/kg, which exceed CCME Guidelines but are comparable to reported control arsenic values. All other samples submitted for analysis met the applicable guidelines.

5.2.5 Potential Flare Pit Area

Four boreholes (17BH24 to 17BH27) were advanced as exploratory boreholes in search of a potential flare pit. There was no indication of a potential flare pit in any of the boreholes advanced, and as such, samples were not collected for analysis.

5.3 Quality Assurance/Quality Control

Quality assurance and quality control for analytical data was also assessed by comparing analytical results from select samples to duplicate samples obtained from the same sample location. Primary and duplicate samples were compared and the relative percent differences (RPD) were calculated.

RPD criteria has been applied to field duplicates in order to evaluate the precision of the results. If both the original and duplicate sample concentrations are greater than or equal to five times the laboratory detection limit for a given parameter, the RPD must be less than or equal to 40% (water) and 60% (soils) (CCME, 2016). If the results lie outside of the range, they should be considered estimates only. The results of North Shore's QA/QC program are discussed in Section 5.3.1.

5.3.1 North Shore Environmental's QA/QC Program

Three soil sampling QA/QC measurements were conducted by duplicating soil samples 17C01 1.7 – 1.9 mbgl, 17BH01 2.2-2.5 mbgl and 17BH20 1.3 – 1.5 mbgl (referred to as Dup A 1.7-14.9 mbgl, Dup B 2.2-2.5 mbgl and Dup D 17BH20 1.3-1.5 mbgl). Laboratory comparisons reported good reproducibility for all benzene, toluene, ethylbenzene and total xylene (BTEX), petroleum hydrocarbon (PHC) (F1 – F4), particle size, metals, soluble ions, pH, EC and SAR values, with the exception of Duplicate B. Duplicate B exceeded the RPD comparison for total barium which reported poor reproducibility RPD value calculations. Results for the QA/QC measurements are included in Tables 6 through 8.

6 SUMMARY AND CONCLUSIONS

Between February 4, 2017 and February 5, 2017, 30 boreholes were advanced at the Site. Based upon the results of the Phase 2 ESA, the following conclusions were made:

- Well Centre - One sample (17BH01 3.2-3.4 mbgl) exceeded applicable hydrocarbon criteria for F2 (382 mg/kg) and SAR (7.94). Two samples (17BH01 0.3-0.5 mbgl and 17BH01 0.8-1.0 mbgl) exceeded applicable pH and EC criteria. All other analyzed parameters complied with the applicable guidelines or were deemed comparable to background controls.
- Former Methanol Spill Area - All of the samples submitted for analysis met the applicable remediation guidelines or were comparable to background soil conditions.
- Production Facilities Area - All samples submitted for analysis met the applicable guidelines or were comparable to background soil conditions.
- Flare Area - One sample (17BH21 0.8-1.0 mbgl) exceeded applicable criteria for ethylbenzene (0.64 mg/kg). All other samples submitted for analysis met the applicable guidelines or were comparable to background soil conditions.

Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

7 DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

8 CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY: W.V. JOHNSON, CLS
JUNE, 2000

LEGEND

UTM coordinates are computed for Zone 10 Bearings were derived from the bearing 13° 42' 31" computed between Fd. CLS 77, Post C-02-2 and Wellcentre Spike for Wellsite C-02, and are referred to meridian 123° W.

Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level..
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995227.

Distances shown on grid area subdivisions are UTM plane.
Control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m away from Post.

Elevations were derived from Geodetic Survey of Canada Monument 'Fort Liard' Elev. = 216.299 m.

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.
All coordinates shown are on 1927 North American Datum.
Coordinates were derived from Fd. CLS Post C-02-2 and Fd. Wellcentre spike from Wellsite Plan Para et al Liard Unit C, Sec. 02, Grid Area 60° 10', 123° 15'.

Certified Correct and completed on the 14th day of June, 2000.
W.V. Johnson Canada Lands Surveyor
Date: June 14, 2000

SOIL ANALYSIS REVIEWED BY: Qiuhong Dong, Lab Technician A

TRACE ORGANICS REVIEWED BY: Ngoc (Ruby) Vu, Lab Technician

DATE REPORTED: Apr 20, 2017

PAGES (INCLUDING COVER): 56

VERSION*: 6

Should you require any information regarding this analysis please contact your client services representative at (780) 395-2525

*NOTES

VERSION 6:Version 6 supersedes Version 4. Added detailed salinity and extended metals to 245, 253, 262, 288 and 300 - April 20th, 2017 RV.

Monoethylene glycol has been revised to say: ethylene glycol - February 13th 2017 CS.

Version 2 supersedes version 1 issued on February 13th 2017. Added add BTEX/F1-F4 to samples: 138, 148, 153, 156, 158, 213, 219, 222, 226, 243, detailed salinity to: 112, 129, 143, 152, 154, 157, 174, 182, 193, 200, nickel to samples: 112, 129, 143, 152, 154, 157, 092, 093, 096, 097, 095, 109, 110, arsenic and selenium to samples: 092, 093, 096, 097, 095, 109, 110, extractable barium and fusion barium to: 134, PAH to: 229, 246, 250 and methanol to samples: 160, 167, 174, 182, 193, 200, 208, 216, 227 and 234 - February 23rd 2017 CS.

Version 3 supersedes version 2 issued on February 23rd 2017. Added detailed salinity to samples: 092, 093, 100, 104, 106 and 107 - March 6th 2017 CS.

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8181089-8181311 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Surrogate	Unit	Acceptable Limits		
Toluene-d8 (BTEX)	%	50-150		69
Ethylbenzene-d10 (BTEX)	%	50-150		63
o-Terphenyl (F2-F4)	%	50-150		74

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8181128-8181309 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

Polyaromatic Hydrocarbon Analysis in Soil

DATE RECEIVED: 2017-02-09

DATE REPORTED: 2017-04-20

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8181229-8181250 Results are based on the dry weight of the sample.
Based on GC/MS target ion analysis.
Isomers Benzo(b)fluoranthene and Benzo(j)fluoranthene have the same GC retention time and are reported as the sum of the two.
B[a]P TPE, IACR (Coarse) and IACR (Fine) are calculated parameters. They are calculated according to the Alberta Tier 1 Soil and Groundwater remediation Guidelines, May 23, 2014. Note that if the analysis returns non-detects for a parameter, ½ the detection limit is entered into the formulas.

I. Borehole Logs, Tables, and Drawings from North Shore Preliminary Stage 2 Report
II. Historical Borehole Logs
III. Water Well and Water Body Search Results

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen completed a Desktop Remediation™ (DTR) review of historical environmental site assessment information and data for the Paramount former wellsite *PARA ET AL* N-01 - 60-10-123-15, with Well Identification number 1902 (the Site). The Site is in the South Liard field of the Northwest Territories.

The scope of work for the DTR involved reviewing and assessing available analytical data to determine the applicability of various guidelines based on land uses and receptors at the Site. Recommendations for remediation at the Site will be provided based on regulatory requirements.

The areas of potential environmental concern (APECs) identified in the 2017 Phase 1 ESA for the Site by North Shore Environmental Limited (North Shore) were the Well centre; production facility areas; the flare stack/flare knockout drum area; spill area in the northeast corner; and other reported spill areas. (North Shore, 2017a). The areas of environmental concern (AECs) identified in North Shore's 2017 Phase 2 ESA for the Site were the Well centre area, due to one soil sample with exceedances of Fraction 2 petroleum hydrocarbons in soil (F2 PHC), and two soil samples with elevated salinity; and the Flare Area, due to one soil sample with an exceedance of ethylbenzene.

2. CURRENT SITE DESCRIPTION

The Site was winter-access, and the well-produced natural gas, produced water, and condensate from 2001 to 2005. The well was drilled to a depth of 1940 meters on December 12, 2000, with the rig released on January 16, 2001, in the South Liard field, approximately 27 kilometres (km) southwest of Fort Liard, Northwest Territories (NT). The Site location is presented on Drawing PAR6210-001.

The Site was approximately 150m x 150m, with a 30m x 60m campsite west along the main access road, and a proposed 40m x 60m borrow pit south along the main access road. Site details and surrounding land uses are shown on Drawing PAR6210-002 and PAR6210-003. Table A below summarizes general information regarding the Site's location, topography, hydrogeology, and surrounding land uses.

TABLE A: Summary of General Information

Item	Description
Site Latitude & Longitude	60° 00' 52.15" N, 123° 16' 04.45" W
NTS Map	N-01 - 60°-10'-123°-15'
Well ID #	1902
Land Owner(s)	Crown
Drilling Dates	December 12, 2000 to January 16, 2001
Total Depth	1940 m
Site Description & Size	Site dimensions are approximately 150 m x 150 m square, with the north boundary to the North, and access from the west.
Site Facilities	Wellhead was located at the centre of the Site; flare stack, production facilities
Topography:	
Regional Surface Grade	The regional grade is gently sloping northeast (0-1%) towards a tributary of the Liard River
On Site Drainage	The lease slopes northeast (0-1%) based on the survey details
Surface Cover	In 2017 the Site was covered in birch saplings.
Geology	Bedrock geology consists of Wapiti Formation which is comprised fine clastic sedimentary rocks, Conglomerate, fine to coarse grained sandstone; carbonaceous shale and coal from cretaceous geological period [BCGS online map resource].
Hydrology & Hydrogeology:	
Nearest Surface Water	Government of NWT ATLAS website shows no water bodies within 500m of the Site. A dugout/borrow pit is visible ~570m west of the Site.
Water Wells	Government of NWT ATLAS website shows no water wells within 500m of the Site (Appendix III).
Depth to Groundwater	Unknown
Groundwater Flow	Unknown but likely to the east towards the unnamed tributary of the Liard River

Item	Description
Surrounding Land Use (Site)	
North	Mixed wood Boreal forest
East	Mixed wood Boreal Forest
South	Mixed wood Boreal Forest
West	Mixed wood Boreal Forest

3. HISTORICAL REVIEW

The scope of this report included a review of available historical environmental site assessment (ESA) information for the Site. Findings from the review of the available reports are summarized below.

3.1 Phase 1 ESA - 2017

North Shore completed a Phase 1 ESA on the Site, published in March of 2017. The Phase 1 ESA indicated the well was a producing well from 2001 to 2005. Production facilities were located at well centre and the northwest and northeast corners of the Site. Based on Compliance Option #1 checklist, the on-site drilling waste disposal area (DWDA) did not require assessment for disposal of drilling waste (North Shore, 2017a).

Two spills were associated with the Site: 150 L of produced water from a pipeline in August 2006; and 135 L of methanol from a drum. A biopile was constructed on the Site for remediation of the 2007 produced water spill; sampling of the biopile found benzene, ethylbenzene, toluene, and PHC Fraction 3 (F3) PHC that exceeded applicable guidelines. Concentration of metals and salinity parameters were at natural level and below the applicable guidelines (Ready Environmental Inc., 2007). Ready Environmental and Crosshair Computing completed delineation of hydrocarbon at the Site. Approximately, 1200 m3 of contaminated soil was excavated and stockpiled in two biopiles and sampled in 2007 and 2008. The lab results indicated that hydrocarbon concentrations decreased except benzene and ethylbenzene were above applicable guidelines in some samples.

In 2008 the biopile was mixed, and soil from the southwest corner and northeast portion of the berm was added to the biopile. In March 2009, the biopile was turned; no further sampling information was available for review for the biopile.

In 2004, three groundwater wells were installed, with two more installed in 2005. Groundwater results from 2008 showed total dissolved solids, and dissolved manganese above applicable guidelines in all wells; well BH106 also had dissolved zinc above the freshwater aquatic life guideline limit. Groundwater monitoring wells were assessed in eight sampling events prior to June 2011. The concentration of BTEX and PHC fractions F1 and F2 in all groundwater samples were below the laboratory detection limit and the drinking water criteria in all wells. Cadmium and iron concentrations exceeded the FAL criteria in all surface water samples. Elevated aluminium concentrations reported in three monitoring wells at the Site. However, 2011 elevated results were due to a changed sampling technique since the samples were

not filtered and preserved in the field. Therefore, they do not reflect true dissolved concentrations. All hydrocarbon and methanol parameters in soil were below the soil quality guidelines. Paramount recommended to discontinue groundwater monitoring and soil monitoring at the site.

The site visit in February 2017 showed an excavated area on the northeast portion of the wellsite; two 400 barrel above-ground storage tanks (AST); and one AST south of the separator; two flare lines from well centre to the northeast; and above-ground piping from well centre to various production facilities. There were two flare stacks noted in the northeast of the Site, a separator, an incinerator, and 3 meter shacks noted (North Shore, 2017a).

3.2 Phase 2 ESA - 2017

North Shore completed a Phase 2 ESA on the Site, published in May of 2017. The Phase 2 ESA investigated the APECs identified in the Phase 1 ESA for the Site, and consisted of 30 boreholes advanced at the Site, to a maximum depth of 6.0 meters below ground (mbg). Analytical results from the Phase 2 ESA were compared to the following guidelines for the respective parameters: Canadian Council of Ministers of the Environment (CCME) 2017 Tier 1 Soil Remediation Guidelines and the 2003 Northwest Territories Environmental Guidelines for Contaminated Site Remediation for pH and salinity parameters (North Shore, 2017b). Results from the Phase 2 ESA showed elevated arsenic that was comparable to background levels across the Site, and one sample with elevated nickel comparable to background concentrations. Results showed one subsurface sample at the Well Centre exceeded for F2 PHC and sodium adsorption ratio (SAR), and two samples from the surface failed for pH and electrical conductivity (EC). Results from the Flare Area showed one surface sample exceeded CCME Tier 1 guidelines for ethylbenzene (North Shore, 2017b). Recommendations for further work were not provided in the Phase 2 ESA (North Shore, 2017b).

4. SUMMARY OF SITE SOIL CONDITIONS

Based on a review of historical reports, SynergyAspen developed a list of areas of environmental concern (AECs) for the Site. The AECs, along with contaminants of concern (COCs) and associated regulated parameters, are shown on Table B below. The AEC is shown in Drawing PAR6210-002.

TABLE B: AECs and Associated COCs in Soil

AEC Label	AECs	Impacted Borehole(s)	COCs (depth)
A	Well Centre	17BH01	pH & EC (0.3-1.0 mbg) Fraction 2 PHC & SAR (3.2-3.4 mbg)
B	Flare Area	17BH21	Ethylbenzene (0.8-1.0 mbg)

Soil Stratigraphy

There were two background boreholes advanced at the Site in the North Shore 2017 Phase 2 ESA. Soil stratigraphy at background borehole 17C01 was organic/muskeg to 0.8mbg, overlying clay-loam and clay to 2.0mbg, followed by a layer of wet sandy-loam to 2.2mbg, overlying firm clay to 6.0mbg, the total depth of assessment. The profile in 17C02 was organic/muskeg to 0.8mbg, overlying clay-loam to 1.5mbg, followed by firm clay to 4.5mbg, the total depth of assessment. (North Shore, 2017b).

The stratigraphy at the wellbore APEC was shown in boreholes 17BH01 through 17BH05. Stratigraphy was described as a sandy-clay pad to 0.1mbg, overlying clay or hard clay to 4.5mbg, the maximum depth of assessment. In 17BH03, clay or hard-clay was noted to 3.8mbg, followed by silty-clay-loam to 4.5mbg, the total depth of the borehole (North Shore, 2017b).

Hydrogeology

Four soil samples collected at varying depths from the background boreholes were analyzed for grain size analysis, using the sieve pan methodology. The sieve method provides the percentage split between coarse and fine-grained material based on retention on a 75µm mesh screen sieve. The grain size analysis results ranged from 10% to 26% retention on the sieve, indicating fine-grained material was dominant throughout the soil profile at the Site (North Shore, 2017b).

The shallow subsurface regional geology of the area north of Maxhamish Lake was reviewed through borehole logs from Phase 2 ESAs completed at four sites in the region. The borehole logs from the following sites were reviewed:

- PARA ET AL MAXHAMISH B- 21-K/094-O-14 (WA#03717) (North shore, 2017c)
- PARA ET AL MAXHAMISH B- 043-K/094-O-14 (WA#12563) (North shore, 2017d)
- PARA ET AL MAXHAMISH B- 083-K/094-O-14 (WA#13773) (North shore, 2017e)
- PARA ET AL MAXHAMISH A-96-J/094-O-14 (WA#13772) (North shore, 2017f)

The sites were located respectively approximately 9 kilometres (km) south, 7.1km south-southwest, 3.5km south, and 4.7km southeast of the N-01 Site. Soil stratigraphy at the b-21-K/94-O-14 site was topsoil and silty-clay overlying clay subsurface. Delineation boreholes around the site showed clay overlying hard clay, with minor occurrences of sandy loam. Hydraulic conductivity testing was completed at the site from 3 groundwater monitoring wells installed during the Phase 2 ESA: hydraulic conductivity values ranged from $1.0x10^{-9}$ meters per second (m/s) to $2.0x10^{-10}$ m/s, as expected from the soil type at the site (2017c).

The soil profile at background locations at the b-043-K site showed loam surface soil to 0.2m, overlying clay-loam soil to approximately 3.0mbg, followed by silty-clay-loam to 4.5mbg, and silty-loam to 6.0mbg. All samples from various depths submitted for grain-size analysis through sieve analysis showed fine-grained soils dominant in the soil profile at the site (North Shore, 2017d).

The borehole logs from background locations at the b-083-K and A-96-J sites showed consistent profiles with loam surface soil to 0.2mbg, followed by clay to approximately 3.0 mbg, overlying “hard clay” to 6.0mbg, the maximum depth of investigation; a layer of silty-clay was noted in one borehole from the a-069-J site. A sand layer was noted in one borehole from 2.4-2.8 mbg at the b-083-K site. All samples submitted for grain-size analysis through sieve analysis from both sites showed fine-grained soils dominant in the soil profile at the sites (North Shore, 2017e,f). Copies of the reviewed borehole logs and figures are provided in Appendix I and II.

From the Phase 2 ESA for the Site and hydraulic conductivity information the region, there was a sufficient minimum confining layer present between the Site and a deeper regional aquifer. Hydraulic conductivity values of the deeper soils at the Site would be expected to be low due to the hard clay soil at the Site. Therefore, drinking water (DW) standards would not apply at the Site within the shallow soils, but would apply in the deeper aquifer unit, if present. At the time of the assessments there were no water wells, water bodies, or residences within 500m of the Site.

5. ENVIRONMENTAL REGULATORY FRAMEWORK

Numerical soil standards for evaluating the results of the Phase 2 ESA were based on the CCME 2018 Canadian Environmental Soil Quality Guidelines (the CESQ), and the Northwest Territories Environmental Guidelines for Contaminated Site Remediation (the Environmental Guidelines) (Minister of the Environment and Natural Resources [ENR], 2003). The selection of applicable guideline limits in both documents are dependent upon site conditions, applicable receptors at a site, and relevant exposure pathways. From the land use definitions and soil depth considerations in the guideline documents, the Residential/Parkland land use was used to evaluate the 2017 Phase 2 ESA results for the Site.

For assessment of the available data for the N-01 Site, the Tier 1 – Criteria-based Approach described in the Environmental Guidelines and the CESQ guidelines were used to determine the applicable F2 PHC and salinity concentration limits for the Site.

For the evaluation of receptors and pathways related to groundwater protection, water use considered proximity to potable water and aquatic receptors, current and potential future use of groundwater aquifers as water sources, and the potential for groundwater extraction based on the hydraulic conductivity of the shallow regional soils.

From the Site information in Section 2, there were no groundwater wells, water bodies, or residences within 500m of the Site. Based on the rationale in Section 4 regarding low hydraulic conductivity due to fine-grained soil in the region, and the lack of water bodies, water wells or residences in proximity to the Site, the Protection of Potable Groundwater, Protection of Freshwater Aquatic Life, and Protection of Livestock Watering pathways would not be operative at the Site.

The following receptor pathways were determined to be applicable at the Site:

For analytical results from soil samples <1.5mbg:	For analytical results from soil samples >1.5mbg:
• Direct Contact; and • Ecological Soil Contact.	• Ecological Soil Contact; • Nutrient and Energy Cycling.

5.1 Guideline Derivation

From the evaluation of receptor pathways at the Site, the Protection of Potable Groundwater pathway was not applicable at the Site. Therefore, the guideline limit for F2 PHC in fine-grained surface for Residential/Parkland land use for the soil below 1.5 mbg was determined to be 2200 milligrams per kilogram (mg/kg), based on the Ecological Soil Contact pathway as described in the ENR *Tier 1 Criteria-based Approach*.

6. COMPARISON OF DATA

Based on the 2017 Phase 2 ESA, soil analytical results were compared to the applicable guideline limits with respect to the operative receptor pathways at the Site. Table C below shows the historic Site soil data compared to applicable soil guidelines at the Site:

TABLE C: Soil Quality Guidelines applicable at the Site (mg/kg)

Parameter	2017 Analytical Results	ENR 2003 Residential/ Parkland	ENR 2003 Residential/ Parkland*
F2	382	250	2200
Ethylbenzene	0.64	1.2	-
pH	3.42-4.46	6-8	-
EC	4.59-4.64	2	-
SAR	7.94	5	-

*Guideline for Ecological Soil Contact, samples >1.5mbg

Rationale regarding salinity on the Site because of the presence of naturally occurring salts of calcium and magnesium sulphates is provided in the next section. As well, further discussion regarding the applicability of various guidelines with respect to expected land uses, available receptors, and site-specific conditions is included in the next section.

7. RESULTS AND CONCLUSIONS

Exceedances for pH and EC in surface samples, and F2 PHC and SAR in the subsurface were noted in soil samples collected near the Wellbore at the Site. An ethylbenzene exceedance was noted in the surface soil of the Flare Area at the Site. Analytical soil data from the 2017 North Shore Phase 2 ESA were compared to current ENR and CCME guidelines applicable to the Site. A discussion of the results is presented below.

7.1 Soil Results

7.1.1 Ethylbenzene

The single exceedance for ethylbenzene at the Flare Area was noted at 0.8-1.0mbg, with the soil sample collected deeper showing results of non-detect/below guidelines. The concentration in the single sample, 0.64 mg/kg, was compared to the ENR 2003 guideline limit for ethylbenzene in fine-grained surface soil, with a limit of 1.2 mg/kg. The result from the single sample was found to be below the ENR guideline applicable to the Site. Therefore, the ethylbenzene exceedance noted at the Flare Area did not pose a risk to human or ecological receptors at the Site.

7.1.2 F2 Petroleum Hydrocarbons

The exceedance for F2 PHC in a soil sample collected near the Wellbore was in the subsurface, at a depth of 3.2-3.4mbg, with the samples above and below the affected sample showing non-detect/below guidelines. Based on the summary of site conditions in Section 4, the result was compared with the ENR guideline for PHC in subsurface soils (>1.5mbg) with the Protection of Groundwater pathway removed, a limit of 2200 mg/kg. The single sample result of 382mg/kg was below the ENR guideline applicable to the Site, therefore the result did not present a risk to human or ecological receptors at the Site.

7.1.3 Salinity

Soil samples from the Wellbore area showed pH below the acceptable range and elevated EC in two samples from 0.3-1.0mbg, and an elevated SAR at a depth of 3.2-3.4mbg in one sample. The elevated EC in the surface samples correlate with the increase in calcium and magnesium sulphate salts in the soil profile. Results from the background samples show an increase in calcium and magnesium sulphates at a depth of 4.7-4.9mbg. Therefore it is likely that the elevated EC at the Well Center was the result of bringing deeper profile soils with higher levels of naturally occurring sulphate salts to the surface during drilling. As the elevated EC is not associated with an increase of sodium or chloride, the elevated EC in the two surface samples was likely the result of the movement of soil from depth to the surface at the Site. Therefore, the elevated EC did not present a risk to receptors at the Site.

The increased SAR in the single soil sample from 3.2-3.5 mbg near the Wellbore was the result of decreased concentrations of calcium and magnesium, relative to a moderate increase in sodium in the soil profile. Calcium concentrations in the soil profile ranged from 17 to 386 mg/kg, magnesium concentrations ranged from 3 to 372 mg/g, and sodium ranged from 3 to 157 mg/kg. Calcium concentration in the sample was 35 mg/kg, and magnesium concentration was 7mg/kg, compared to a sodium concentration of 157 mg/kg; chloride concentration was 97mg/kg in the sample. While the increased sodium relative to calcium and magnesium in the sample resulted in an increase in SAR, the depth of the sample was below the Ecological Soil Contact pathway. Therefore, the elevated SAR did not present a risk to receptors at the Site.

7.1.4 Arsenic

Elevated arsenic concentration ranged from 13.4 mg/kg to 16.8 mg/kg, above the CCME guideline of 12mg/kg (North Shore, 2017) across the Site. The CCME Residential/Parkland guideline for arsenic in soils was based on protection of human health from soil ingestion with a limit of 12mg/kg, and the protection of environmental health, with a soil contact limit of 19mg/kg (CCME, 1997). The 1991 CCME interim guideline for arsenic was 50mg/kg.

Referring to fact sheets and guidance from the CCME and ENR, a discussion regarding application of guidelines for arsenic with respect to the site-specific conditions follows:

- If a spill or release led to the exceedances for arsenic, contamination from other chemicals, including hydrocarbons, salinity, and metals would be expected. As no residual hydrocarbon, salinity, or metals parameters were indicated in the analytical results for the samples, it was unlikely that the elevated Arsenic concentrations were the result of a spill or release.
- ENR Guidelines for soil in and around the Yellowknife area noted natural occurrences of Arsenic up to 300mg/kg, with the average in and around the Yellowknife area of 150mg/kg (ENR, 2003). The ENR determined a remediation objective of 160mg/kg for Residential land use in Yellowknife area soils, based on accessibility (soil ingestion and soil contact) to the yard for 2 hours per day, 5 months of the year (ENR, 2003). The Site is in a remote setting where access is limited to helicopter transport or winter roads, and toddlers or the public are not expected on a regular basis at the Site. For the Site, access by the public is currently less than 5 months of the year for the CCME maximum concentration of 12.0mg/kg in soil.

In addition, arsenic concentrations in the background/control boreholes show increasing arsenic with increasing depth. Based on the above rationale, the Arsenic exceedances detected at the DWDA did not pose a risk to human and ecological receptors at the Site.

7.2 Conclusions

Based on a review of results from the 2017 Stage 2 PSI at the Site, SynergyAspen determined that the F2 PHC, ethylbenzene, arsenic, EC and SAR exceedances at the Site were reasonably expected to pose no risk to receptors at the Site. Rationale for the determination was based on the applicable guideline limits; naturally occurring calcium and magnesium salts in the soil profile; and the depth of the samples.

8. CLOSURE

Based on the evaluation of the available historic data, no further environmental work is required at the Site prior to submission of the report to the ENR.

Thank you for the opportunity to conduct the work presented herein. If you have any questions or comments, please do not hesitate to contact the undersigned at 250-785-1030.

Respectfully Submitted,

SYNERGYASPEN ENVIRONMENTAL INC.

10. USER RELIANCE AND GENERAL LIMITATIONS

10.1 User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited (the Client). The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

10.2 General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

LEGEND

UTM coordinates are computed for Zone 10 Bearings were derived from the bearing 13° 42' 31" computed between Fd. CLS 77, Post C-02-2 and Wellcentre Spike for Wellsite C-02, and are referred to meridian 123° W.

Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9996227.

Distances shown on grid area subdivisions are UTM plane.
Control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m away from Post.

Elevations were derived from Geodetic Survey of Canada Monument 'Fort Liard' Elev. = 218.299 m.

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.
All coordinates shown are on 1927 North American Datum.
Coordinates were derived from Fd. CLS Post C-02-2 and Fd. Wellcentre spike from Wellsite Plan Para et al Liard Unit C, Sec. 02, Grid Area 60° 10', 123° 15'.

Paramount Resources Ltd.
Para et al Fort Liard O-35 60°10' 123°15'
Phase 1 Environmental Site Assessment
March 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

INTRODUCTION

Paramount Resources Ltd. (Paramount) retained North Shore Environmental Consultants Inc. (North Shore) to conduct a Phase 1 Environmental Site Assessment (ESA) for the Para et al Fort Liard O-35 gas well located in the Northwest Territories (NWT) at Unit O, Section 35 Grid Area 60° 10', 123° 15' (Site).

The purpose of the Phase 1 ESA was to assess and qualify potential environmental concerns associated with the Site through a historic records review and site visit. The Phase 1 ESA was conducted in general accordance with the Canadian Standards Association (CSA) *Standard Z678-01: Phase I Environmental Site Assessment* (CSA, 2001). The Alberta Energy Regulator (AER) *Assessing Drilling Waste Disposal Areas: Compliance Option for Reclamation Certification* (AER, 2014) guidelines were used to assess the drilling waste associated with the Site.

FINDINGS

The Para et al Fort Liard O-35 well was drilled between November 2, 1999 and December 4, 1999 to a depth of 2121 m. The rig was released on December 29, 1999. The well produced sweet natural gas between 2000 and 2005 before the site was deactivated by Paramount in April 2008. Fluids were transported from the site via pipeline to the Paramount Maxhamish d-36-I compressor station in BC. The wellsite is accessible by helicopter and winter roads.

Infrastructure identified in association with the site includes the following: wellhead, flare knockout drum with vent stack, pipeline, flowlines, meter run, separator methane pump building with vent stack, pig launcher, and methanol tank in containment dyke. According to the Paramount June 2009 As-built sketch of the area, a borrow pit/remote sump was located southeast of the wellsite along the access road and a campsite area was located east of the borrow pit/remote sump. There were no log decks identified in association with the wellsite.

Drilling Waste Disposal

According to the Paramount Resources Ltd. Final Well Report, the surface hole gel-chem drilling mud was hauled off site and treated at a remote sump. As-built diagrams show the remote sump/borrow pit was located southeast of the wellsite on the south side of the access road. The invert mud used for the intermediate section of the well was re-used at another location.

The main hole was drilled underbalanced with nitrogen as a carrying medium; however, the exact location of disposal of the main hole waste is not known. As a worst case scenario, it is assumed the main hole drilling waste was also disposed of at the remote sump.

Due to a lack of formal drilling waste disposal documentation, a Compliance Option 2 checklist and associated calculations were completed. The metal and salt calculations were completed only for the surface and main hole drilling mud additives as the intermediate hole waste was hauled off site. Drill stem tests (DSTs) 2 to 6 were run during main hole drilling and have been included in the calculations. The combined surface and main hole depths were used for the calculations and the drilling waste exceeds the barite and salt calculation criteria.

File review documentation indicated that the remote sump was lined; however, there is no information available identifying how the drilling waste at the remote site was treated or disposed of. Further investigation of the remote sump area is required. A September 2000 Environmental Inspection report completed by Indian and Northern Affairs noted the sump area was slumped.

DSTs were conducted during drilling of the intermediate and main hole sections of the well and recovered drilling mud and slightly gasified drilling mud. Well Testing and DST Evaluation reports indicated the well was 'vented to the pit' during DST testing and as a result further assessment of the drilling flare pit is recommended.

Spills & Complaints

A review of the NWT Resource Wildlife and Economic Development's Hazardous Material Spill Database identified the following spill associated with the O-35 wellsite:

Spill No.	Date	Spill Location	Product Released	Volume	Source
2009053	February 3, 2009	O-35 Wellsite	Diesel Fuel	1000 L	Storage Tank <4000 L

An August 2008 Well Inspection Report completed by the National Energy Board noted a small amount of soil staining around the wellhead where equipment had been located.

An NWT Spill Report identified on off lease spill along the access road into the F-36 wellsite between January 21 and 23, 2000. It was estimated that 800 L of waste was released on the access road during rig move events and accumulated in two low spots along the road; however the exact locations are not known. There was contradicting information available with respect to the type of material released. One spill report indicated that the spill material may have contained hydrocarbons and had a hydrocarbon odor while another spill report identified the material as drilling fluid. Snow was windrowed to the road centre and then cleaned up and taken to the remote drilling waste lined sump at O-35.

Previous Assessments/Reports

Alpine Environmental (Alpine) completed an Annual Environmental Site Assessment report in July 2003. The purpose of the assessment was to visually inspect the lease and, if any areas of concern were observed, field screen soil and obtain samples for laboratory analysis. Eight hand auger soil samples were collected from two large areas with minimal vegetation coverage to the north and southeast of the facilities area and from a dry trench to the east of the methanol tanks. One sample was analysed for hydrocarbons, metals and salinity. The results of the assessment indicated that no environmental impacts were identified but further maintenance work at the site was required.

In 2005, a second Annual ESA report was completed for the site by Alpine. The report concluded that there were no indications on site that further sampling was required. Although no environmental impacts were identified during the 2005 assessment, further maintenance work at the site was still required.

Interviews

There were no Paramount operations personnel with historic knowledge of drilling or production activities at the Site available for an interview.

Site Visit

A site visit was completed on February 6, 2017 under snow conditions. The site was generally level and vegetation identified from the previous year's growing season through the snow included yellow rattle, fescue, will, spruce, pine aspen and alder and appeared to be consistent with off site areas. Infrastructure present on site consisted of a 400 bbl tanks in containment, above and below ground pipelines, riser, pigging station, flare stack and knock out drum, methanol pump, meter shack, pilings and risers. The borrow pit/remote sump area located to the east of the site was well vegetated.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information gathered for this Phase 1 ESA from the historic records review and the site inspection, North Shore concludes that there is a potential for environmental impact in connection with the site. A Phase 2 ESA is recommended to assess the following areas of potential concern:

- Well centre;
- Production facility/flare stack areas;
- Former spill areas at the well centre and storage tank areas;
- Remote drilling waste disposal area at O-35; and
- Potential drilling flare pit area.

DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

In the preparation of this report, selected Alberta Energy Regulator (AER) reference material has been gathered from AbaData™ (property of Abacus Datagraphics Ltd.), which is an online information source. The information provided by AbaData is received directly from the AER, electronically updated on a monthly basis and is assumed to be correct.

CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

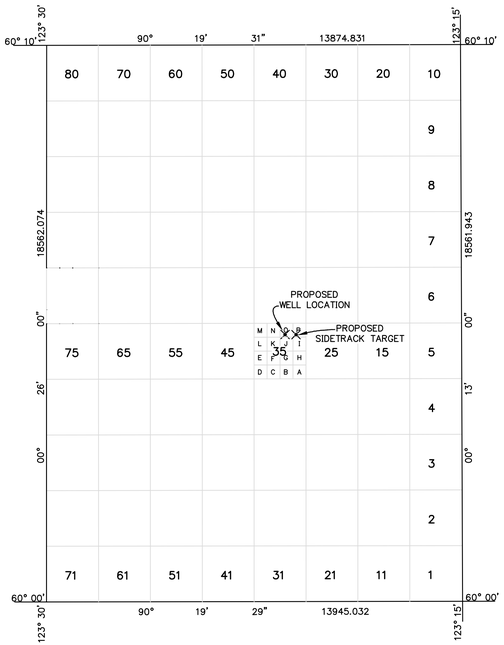
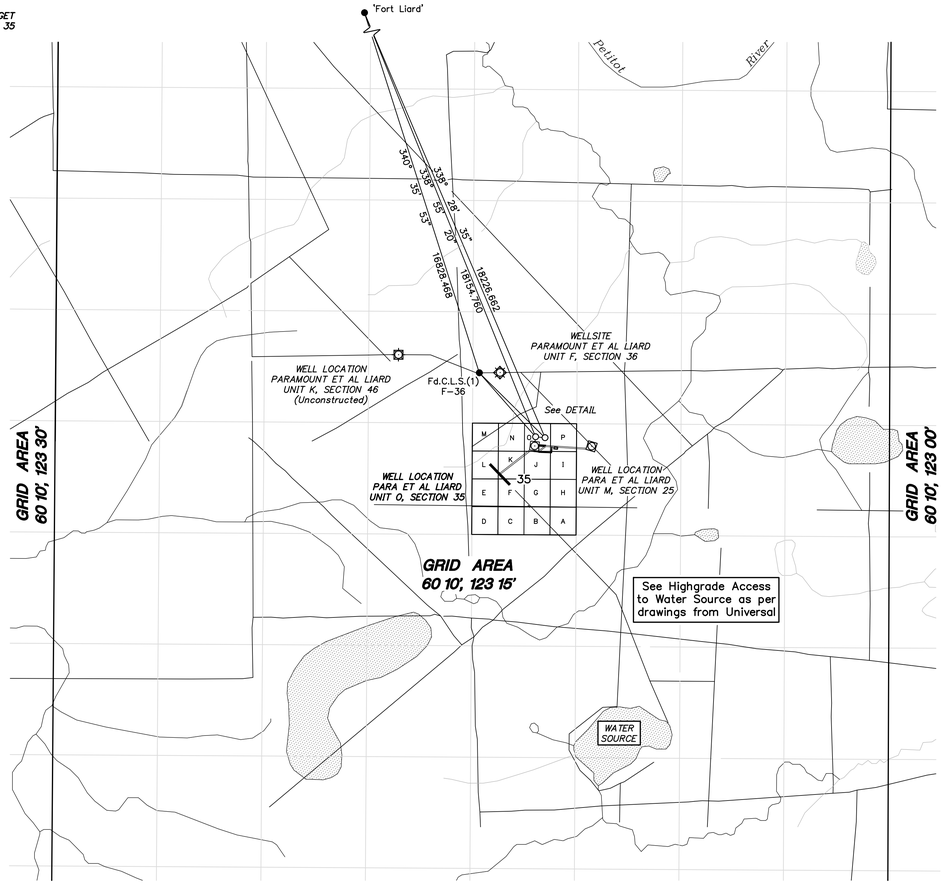
DETAIL
UNIT O, SECTION 35
SCALE 1:5,000



GRID AREA 60°10', 123°15'
SCALE 1:100,000

AREAS REQUIRED:

WELLSITE:	150mx150m =	2.25 ha.
REMOTE SUMP & BORROW PIT:	VARIABLE =	1.51 ha.
TOTAL:		3.76 ha.



All coordinates shown are on 1927 North American Datum.
Wellsite control established using differentially corrected GPS observations.
Final coordinate values for control were transformed from NAD83 datum to NAD27 datum using National Transformation Version 2 program.
Geodetic Survey of Canada published coordinate values for monument 'Fort Liard' were held fixed. Adjusted values for Fd.CLS(1) F-36 Grid Area 60°10', 123°15' and comparison to published coordinates are shown below.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : R.O. BLACKALL, CLS
JUNE, 1999.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995353. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic of Canada Monument 'Fort Liard' Elev. = 216.299m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, R.O. Blackall, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

R.O. Blackall, CLS

Sworn before me at Fort St. John, this 06th day of July, 1999.

Brent,

I have included a table below that shows the annual production statistics gathered by the NEB for the Fort Liard fields.

There are four fields:

- Liard Wells: Liard F-25A, K-29, M-25, 2K29, 3K-29, 2M-25, K29A
- Liard North Wells: North Liard P-66A
- Fort Liard SE Wells: SE Fort Liard N-01
- Fort Liard Wells: Fort Liard F-36, O-35

There is monthly data by well, but it would take me a while to compile the historical records for release. Please let me know if this information suits your purpose, and feel free to call if you have any questions.

Field Name	Year	Annual Wellhd Gas Prod (10^3m^3)	Annual Oil Prod (m^3)	Annual Cond Prod (m^3)	Annual Wtr Prod (m^3)

Brent,

Thanks for sending the specifics. If the information is readily available, we may have it in a few days, but it can sometimes take a couple of weeks if it has been archived.

In the meantime, I have found production reports for 2005 and 2006. I will see what information I can send you from those reports.

Subject: RE: Looking for Production Information

Hi Kristen,

Thank you for the quick response. The production records that we are looking for are from the early 2000's. Specifically, we are looking for information for the Paramount Resources wells O-35, N-01, I-46, F-36, and A-01. From the information we currently have it looks like these wells produced between 2002 and 2007. I believe there will only be production information for F-36, O-35, and N-01. The other two wells were drilled and abandoned.

Would you be able to see if there are production records for these wells?

Thanks,

Brent

Subject: RE: Looking for Production Information

Hello, Brent,

Thank you for contacting OROGO. As of April 2014, the Regulator has jurisdiction for the regulation of oil and gas works and activities in the onshore Northwest Territories (NWT), with the exception of the Inuvialuit Settlement Region and lands that were not transferred from the Government of Canada to the Government of the Northwest Territories.

Production statistics by field for 2014, 2015, and 2016 are available on our website at www.orogo.gov.nt.ca on the 'Documents' page. The files are listed alphabetically. *Production Statistic Reports* are on page 3, and there is one document for each year. However, all production since 2014 has been from the Cameron Hills field. There has been no recent production in the Fort Liard area. If you need historical production data, let me know and I will see if we can obtain it.

Please feel free to call me if you have any questions.

Subject: Looking for Production Information

Hi Kristen,

North Shore is currently completing Phase 1 ESAs for some wellsites in the Fort Liard area. We are relatively new to working in the Northwest Territories and we are trying to track down production information for the wells. Would this information be available in the OROGO Public Registry? Any help or information that you can provide would be greatly appreciated.

Thanks,

Brent

E. ENVIRONMENTAL CONSIDERATIONS

There were no outstanding environmental considerations on this well. The gel-chem mud system used on the surface hole was hauled and treated at a remote sump. The invert mud system used for the intermediate hole was re-used at another location. The main hole was drilled underbalanced with noitrogen as a carrying medium. In January 2001 the site was recontoured and there are plans for any more work until this well is to be abandoned and reclaimed.

Compliance Option 2
Drilling Waste Disposal Assessment Checklist

Compliance Option 2 - Drilling Waste Disposal Assessment Checklist

If any response to the checklist questions leads to a Phase 2 ESA requirement or there is insufficient information to complete the Compliance Option Two Checklist, a Phase 2 ESA must be conducted in accordance with Compliance Option Three.

1. General Disposal and Drilling Fluid Information:
The well licensee should be able to review various sources of information pertaining to the drilling activities on-site. Many information sources, other than the *Notification of Drilling Waste Disposal*, *Drilling Waste Management Disposal Form*, or *Drilling Waste Pipeline Disposal Form* can be reviewed for information relating to the drilling waste disposal and drilling fluid systems. These can include Tour Reports, daily drilling records, well files, and contractor invoices.

1.0 Well Information:

Unique Identifier (UI)	Para et al Fort Liard O-35
Spud Date	November 2, 1999
Well Depth	2121 m

1.1 Disposal Method (if known)*: Off site disposal

* If waste was disposed at an AER or ESRD approved facility, list supporting documentation under Reference Documents.

1.2 Disposal Location (if known)**: Gel-chem remote sump located southeast of the wellsite and invert was re-used at another location.

** If checklist indicates that a Phase 2 ESA (Compliance Option Three) is required, it must be undertaken at the disposal location. If the disposal location is unknown, the Phase 2 ESA must be undertaken at the wellsite.

For the purpose of this form: if the disposal method and/or location remains unknown after all available information sources have been checked, the drilling waste disposal location is assumed to be on-site.

	Yes	No
1.3 Were there other drilling waste disposal events on the site (e.g. wellbore re-entry or another well drilled, using fluids containing drilling fluid additives)?	☐	☒
If yes, were the disposal areas separate from one another?	☐ Drilling waste information must be evaluated for each disposal.	☐ Drilling waste information must be evaluated by combining the drilling fluid additives and well depths. If drilling waste information is missing or incomplete for one or both wells, a Phase 2 (Compliance Option Three) is required.
	Yes	**No**

	Yes	No
1.4 Was a remote site used? If, Yes, is the remote site included in this reclamation application? If not included, is the remote site a multi-well disposal location?	☒ ☒ ☐ In Comments section, indicate which well the remote site will be tied to for the purposes of reclamation	☐ ☐ ☐ Single well remote disposal site must be included with reclamation certificate application, unless it already has received a Reclamation Certificate.
1.5 Has the well licensee reviewed the Daily Drilling Records and other available drilling documentation?	☒	☐ Phase 2 required
1.6 Can it be determined from the available records what type of drilling fluid system was used?	☒	☐ Phase 2 required
1.7 Were water-based drilling fluids used for all sections (i.e., gel chemical drilling fluid systems)? If No, is there evidence that demonstrates the non-water based wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☒ ☐	☐ ☐ Phase 2 required
1.8 Is a mud list available? If Yes, can all the additives on the mud list be identified and described? Record the additives and their description (e.g., chrome-free lignosulfonate, aldehyde-based bactericide, etc.) on the attached form.	☒ ☒	☐ Phase 2 required ☐ Phase 2 required

	Yes	No
1.9 Do the Daily Drilling Records show evidence of a flow or kick that may have resulted in the introduction of produced fluids (i.e., hydrocarbons or salts) into the drilling fluids?	☐	☒
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* or *Directive 58* (i.e., approved waste management facility)?	☐	☐ Phase 2 required
1.10 Do the Daily Drilling Records show evidence of returned drill stem test fluids?	☒	☐
If Yes, is there information/documentation available to demonstrate that they were appropriately treated or disposed of as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐	☒
If treatment or disposal as per *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* cannot be confirmed, is there sufficient information/documentation available to complete the DST calculations?	☒ Show calculation on attached form	☐ Phase 2 required
1.11 Were cement returns buried on-site or at a remote site linked to the well?	☐	☐

2. Hydrocarbon Management

	Yes	No
2.1 Was hydrocarbon-based drilling fluid used?	☒	☐
If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒	☐ Phase 2 required

	Yes	No
2.2 Was the well a horizontal oil well? If Yes, is there evidence that wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☐ ☐	☒ ☐ Phase 2 required
2.3 Was the well drilled using under-balanced techniques? If Yes, is there information/documentation available to demonstrate that the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☐	☐ ☒ Phase 2 required
2.4 Was hydrocarbon added to the drilling fluid? If Yes, was the hydrocarbon contaminated drilling waste disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., approved waste management facility)?	☒ ☒	☐ ☐ Phase 2 required

3. Metals (Trace Elements) Management

	Yes	No
3.1 Was the disposal completed before November 1, 2012?	☒ Complete questions 3.2 to 3.5	☐ Go to question 3.6
3.2 Was barite added to the drilling fluid? If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ ☐ Show calculation on attached form	☐ ☒ Phase 2 required

	Yes	No
3.3 Was zinc carbonate added to the drilling fluid?	☐	☒
If Yes, did it meet the requirements specified in the attached metal calculation table?	☐ Show calculation on attached form	☐ Phase 2 required
3.4 Were chrome-based thinners added to the drilling fluid?	☒	☐
If Yes, did it meet the requirements specified in the attached metal calculation table?	☒ Show calculation on attached form	☐ Phase 2 required
3.5 Were any other additives used that would have triggered testing for metals under Section 3 or 5 of *Directive 50 (1996 version)*?	☐	☒
If Yes, are waste analytical data and application rates (land treatment, landspreading) or maximum application (mix-bury-cover) available?	☐	☐ Phase 2 required
If above data are available, did the application rate or maximum application meet *Directive 50* requirements?	☐	☐ Phase 2 required
3.6 Did metal concentrations in the waste trigger a requirement for post-disposal sampling?	☐	☐
If yes, did all post-disposal samples meet the soil metal endpoints specified in Section 3 of *Directive 50* (2012 version)?	☐	☐ Phase 2 required

4. Salinity Management

	Yes	No
4.1 Does the water based drilling waste meet the requirements specified in the attached Salt Calculation Table?	☐ Show calculation on attached form	☒ Phase 2 required
4.2 Was a salt zone encountered during drilling?	☐	☒
If Yes, is there evidence that demonstrates the drilling wastes were disposed of in a manner consistent with *Directive 50* (1996 version for disposals before November 1, 2012 or 2012 version for disposals on or after November 1, 2012) or *Directive 58* (i.e., appropriately approved waste management facility)?	☐	☐ Phase 2 required

Surface Gel-chem Drilling Mud Additive List

Product Name	Amount Used	Brief Description of Product
Gel	128 sacks	Viscosifier
SAPP	1 sack	Thinner/Dispersant
Lime	1 sack	Alkalinity pH Control
Caustic Soda	2 sacks	Alkalinity pH Control
Desco	1 sack	Chrome-based Thinner/Dispersant
Detergent	6 sacks	Surface Active Agent
Sawdust	35 sacks	Lost Circulation Material
Soda Ash	4 sacks	Calcium Remover

Intermediate Hole Drilling Mud Additive List

Product Name	Amount Used	Brief Description of Product
Invert	232 m^3	Hydrocarbon Lubricant
Calcium Carbonate	58 sacks	Weighting Material
Soluflake	16 sacks	Lost Circulation Material
Carbo Tec	31 sacks	Oil Mud Emulsifier
Calcium Chloride	19 sacks	Shale Control Inhibitor
Bentone 150	20 sacks	Viscosifier
Lime	19 sacks	Alkalinity pH Control
Milbar	128 sacks	Weighting Material (Barite)
Omni Cote	6 sacks	Oil Wetting Agent
Mil Clean	12 sacks	Surface Active Agent
Sawdust	100 sacks	Lost Circulation Material
Barite	10 sacks	Weighting Material
Milgel	18 sacks	Viscosifier

Main Hole Drilling Mud Additive List

Product Name	Amount Used	Brief Description of Product
Xanvis	34 sacks	Viscosifier
Calcium Carbonate	521 sacks	Weighting Material
Milbar	2337 sacks	Weighting Material (Barite)
Desco	6 sacks	Chrome-based Thinner/Dispersant
Barite	555 sacks	Weighting Material

Drill Stem Test Reports
Paramount Resources Ltd. Daily Drilling Report
Paramount Fort Liard South As-Built June 2009 Map
Paramount Well File Information
Mackenzie Valley Land and Water Board – Public Registry – Online Review System

Comments (Please provide any additional comments relevant to the decision process within the checklist. Attach additional pages if necessary.)

According to the Paramount Resources Ltd. Final Well Report, the surface hole gel-chem drilling mud was hauled off site and treated at a remote sump. As-built diagrams show the remote sump/borrow pit was located southeast of the wellsite on the south side of the access road.

The invert mud used for the intermediate section of the well was re-used at another location.

The main hole was drilled underbalanced with nitrogen as a carrying medium; however, the exact location of disposal of the main hole waste is not known. As a worst case scenario, it is assumed the main hole drilling waste was also disposed of in the remote sump.

Due to a lack of formal drilling waste disposal documentation, a Compliance Option 2 checklist and associated calculations were completed. The metal and salt calculations were completed only for the surface and main hole drilling mud additives as the intermediate hole waste was hauled off site. Drill stem tests #2-6 were run during main hole drilling and have been included in the calculations. The combined surface and main hole depths were used for the calculations.

The drilling waste exceeds the barite and salt calculation criteria.

File review documentation indicated that the remote sump was lined; however, there is no information available identifying how the drilling waste at the remote site was treated or disposed of. Further investigation of the remote sump area is required.

Location: Para et al Fort Liard O-35 **Spud:** 2-Nov-99

Metal Calculations for Compliance Options One and Two

Note: Different default mix ratios are provided depending on whether the well was drilled before or after October 22, 1996. The 1996 version of *Guide 50*, *Drilling Waste Management,* which was issued by the Energy Resources Conservation Board on this date, increased the minimum mix ratio requirement from 1:1 to 3:1.

Barite:

Directions: Fill in the number of sacks and adjust for sack weight if different than 40 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.22** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (40 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
2892	÷	1172	÷	3	=	0.823	Exceeds

* Sack weight may be adjusted by dividing the number of sacks by 40 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter “3”. If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Location: Para et al Fort Liard O-35 **Spud:** 2-Nov-99

Chromium-based Thinner:

Alternative 1:

If waste chromium, mix ratio and waste bulk density data are available use the following calculator to estimate post-disposal chromium concentration.

Directions: Enter the Total Chromium Concentration in mg/kg measured in the waste, the Waste Dry Bulk Density in kg/m3, and Mix Ratio in the appropriate cells. The spreadsheet will calculate the Post-Disposal Chromium Concentration. If this value is greater than 64 mg/kg, a Phase 2 ESA (Compliance Option 3) is required.

Waste Chromium Concentration (mg/kg)		Waste Dry Bulk Density* (kg/m^3)		Mix Ratio						Post-Disposal Cr Concentration (mg/kg)
	x		÷		÷	1500	+	30	=	#DIV/0!

* Waste Dry Bulk Density = (Waste Specific Gravity – 1) x 1600

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

Alternative 2:

If the above data is not available use the following equation to calculate the number of sacks of chrome thinner added per meter drilled. If the number of sacks exceeds the limits below, a Phase 2 is required.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the number of sacks per metre. This value must be less than or equal to **0.020.** If the value exceeds the objective, a Phase 2 ESA (Compliance Option 3) must be conducted.

Total Number of Sacks (25 kg/sack*)		Well Depth (m)		Mix Ratio**		Sacks per Metre	
7	÷	1172	÷	3	=	0.00199	Meets

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Enter the number of parts of soil mixed with one part of waste. For example, for a 3:1 mix ratio (3 parts soil to 1 part waste) enter "3". If this value is not known, enter 1 for wells drilled before October 22 1996, or 3 for wells drilled on or after this date.

= Required Field

Location: Para et al Fort Liard O-35 **Spud:** 2-Nov-99

Salt Calculations for Option 2:

Alternative 2

If the volume of drilling waste is not known, use the following calculator to determine the NaOH Equivalent Sacks per metre of well depth. This value must be less than **0.0260** for wells drilled before October 22 1996, or **0.0350** for wells drilled on or after this date. If the value exceeds the target, a Phase 2 ESA (Compliance Option 3) must be conducted.

Directions: Fill in the number of sacks and adjust for sack weight if different than 25 kg. Enter the Well Depth in metres. The spreadsheet will calculate the NaOH Equivalent Sacks per Metre.

Additive	Number of sacks (25 kg/sack*)		NaOH Equivalency Factor		NaOH Equivalent Sacks
Caustic Soda	2	X	1.00	=	2
Soda Ash	4	X	0.75	=	3
Sodium Chloride		X	0.68	=	0
Sodium Bicarbonate		X	0.95	=	0
Sodium Silicate		X	1.37	=	0
Sodium acid pyrophosphate (SAPP)	1	X	0.22	=	0.22
Calcium Chloride		X	0.72	=	0
Calcium Nitrate		X	0.34	=	0
Envirofloc		X	0.41	=	0
Gypsum**		X	0.59	=	0
Lime**	1	X	1.08	=	1.08
** Max = 0.02 x well depth (m)					
Potassium chloride		X	0.54	=	0
Potassium sulphate		X	0.46	=	0
Caustic potash		X	0.71	=	0
Potassium formate		X	0.47	=	0
Potassium silicate		X	0.32	=	0
Potassium nitrate		X	0.40	=	0
Diammonium phosphate		X	0.63	=	0
Ammonium nitrate		X	0.57	=	0
Ammonium sulphate		X	0.61	=	0
Drill Stem Test Returns	193.5528237	X	0.68	=	131.6159201

Total NaOH Equivalent Sacks	=	137.9159201
Well Depth (m)	÷	1172
NaOH Equivalent Sacks per Metre	=	**0.1177**

Result

Meets

* Sack weight may be adjusted by dividing the number of sacks by 25 and multiplying by the actual sack weight in kilograms. This value should be entered as the number of sacks.

** Note: Up to 0.02 sacks of gypsum and lime per metre of well depth should be counted with other salt additives. Because of the limited solubility of gypsum and lime, sacks in excess of this value need not be counted.

= Required Field

Drill Stem Test Return Calculations for Compliance Option Two

Location: Para et al Fort Liard O-35 **Spud:** 2-Nov-99

Alternative 2: Chloride

Directions: Enter the drill stem diameter for the drill stem test (DST) section in millimeters, the length of the DST return (including mud returns) in metres and the chloride concentration of the DST fluid in mg/L. The spreadsheet will calculate the equivalent number of sacks. This value must be entered in the salt calculation in the cell labelled "Drill Stem Test Returns".

Inner Diameter of Pipe (mm)	Length of Drill Stem Test Return (m)	Volume of Returns (m^3)*		Chloride Concentration* (mg/L)				Number of Sacks
70.2	1357	5.24956997	x	250000	÷	7600	=	172.683223
70.2	164	0.63443587	x	250000	÷	7600	=	20.869601
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
		0	x		÷	7600	=	0
				Total number of sacks			=	193.552824

*If chloride concentration is not specified, use 215,000 mg/L. Chloride concentrations from formation water databases or adjacent wells are currently not acceptable.

= Required Field

Phase 2 Environmental Site Assessment

North Shore Environmental Consultants Inc. is pleased to submit our Phase 2 Environmental Site Assessment Report for the O-35 wellsite (60°10', 123°15') belonging to Paramount Resources Ltd.

North Shore appreciated the opportunity to work on this project and if we can provide clarification of any part of this report, please call the undersigned at (780) 467-3354.

Yours truly,

North Shore Environmental Consultants Inc.

Phase 2 Environmental Site Assessment
May 2017

Paramount Resources Ltd.
4700 Bankers Hall West
888 3rd Street SW
Calgary, Alberta T2P 5C5

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the O-35 (60°10', 123°15') wellsite (Site) and remote drilling waste disposal area (DWDA) located near Fort Liard, NWT. The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017. Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines. The areas of potential environmental concern included the following:

- Well centre;
- Production facility/flare stack areas;
- Former spill areas at the well centre and storage tank areas;
- Remote DWDA at O-35; and
- Potential drilling flare pit area.

Between February 6, 2017 and February 8, 2017, 63 drilling (solid-stem) boreholes and one hand auger borehole were advanced at the Site and DWDA. Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

List of Appendices

1 INTRODUCTION

North Shore Environmental Consultants Inc. (North Shore) was retained by Paramount Resources Ltd. (Paramount) to conduct a Phase 2 Environmental Site Assessment (ESA) at the O-35 (60°10', 123°15') wellsite (Site) and remote drilling waste disposal area (DWDA) located near Fort Liard, Northwest Territories (NWT).

1.1 Objective

The objective of the Phase 2 ESA was to assess areas of potential environmental concern identified during the Phase 1 ESA conducted by North Shore in March 2017 (North Shore, 2017). Assessment activities included collecting soil samples to determine if select compounds used or produced on the Site exceed the applicable remediation guidelines.

1.2 Scope of Work

The scope of work for the Phase 2 ESA included the following:

- Review background information to assist with establishing site specific protocols.
- Obtain the necessary written agreements from third-party licensees in the area.
- Hire a private utility locating surrounding the proposed ground disturbance locations in the proposed work area and control area (30 meter (m) buffer around the work area).
- Conduct a tailgate safety meeting prior to initiating work each day at the Site. This includes North Shore personnel and any other contractors' onsite.
- Advance 64 borehole locations to investigate background soil conditions and areas of potential environmental concern identified in the Phase 1 ESA (North Shore, 2017).
- Collect samples from each borehole, field screen, and log according to Canadian System of Soil Classification.
- Submit selected soil samples for laboratory analysis to confirm the absence or identify the presence of oil and gas related impacts.
- Prepare a report documenting the findings of the Phase 2 ESA and compare laboratory results with applicable soil remediation guidelines.

2 BACKGROUND

2.1 Site Description

The Site and DWDA are located at Unit O, Section 35 Grid Area 60°10', 123°15' approximately 40 kilometres (km) southeast of Fort Liard, NWT. The Site is located approximately 8 km north of the NWT/British Columbia (BC) border. A location map of the Site is included as Figure 1 and a survey plan is included in Appendix A.

2.2 Land Use and Receptors

The lease is situated on Crown land in a mixed-wood forested area. The Site has not been reclaimed, but natural encroachment from the surrounding forest is evident throughout the lease and DWDA area. An aerial photograph or satellite image of the quarter section is included as Figure 2. Site photographs are included as Appendix B.

2.3 Site History and Infrastructure

The Para et al Fort Liard O-35 well was spudded on November 2, 1999 and drilled until December 4, 1999 to a depth of 2121 metres (m). The rig was released on December 29, 1999. The well produced sweet natural gas between 2000 and 2005 before the site was deactivated by Paramount in April 2008. Fluids were transported from the site via pipeline to the Paramount Maxhamish d-36-I compressor station in BC. The wellsite is accessible by helicopter and winter roads.

Infrastructure identified in association with the site includes the following: wellhead, flare knockout drum with vent stack, pipeline, flowlines, meter run, separator methane pump building with vent stack, pig launcher, methanol tank in containment dyke and 60 m^3 aboveground storage tank in metal containment. According to the Paramount June 2009 As-built sketch of the area, a borrow pit/remote sump was located southeast of the wellsite along the access road and a campsite area was located east of the borrow pit/remote DWDA. There were no log decks identified in association with the wellsite.

2.4 Previous Environmental Work

A Phase 1 ESA was completed by North Shore in March 2017 (North Shore, 2017). Areas of potential of environmental concern that were recommended for investigation included:

- Well centre;
- Production facility/ flare stack areas;
- Former spill areas at the well centre and storage tank areas;
- Remote DWDA at O-35; and
- Potential drilling flare pit area.

3 METHODOLOGY

3.1 Safe Work Procedures

North Shore personnel adhered to Paramount's policies and procedures to complete the assessment and investigation program. Standard oilfield personal-protective equipment (hard hat, steel-toed boots, safety glasses, and fire retardant coveralls) were worn by all personnel on-site. A calibrated four way gas monitor for H_2S, O_2, CO, and organic vapours was also carried by each person participating in the field work. Nitrile gloves were worn when handling soil samples. All personnel onsite were required to possess copies of the applicable safety certification (Ground Disturbance

Level 2, H_2S Alive, Transportation of Dangerous Goods, Workplace Hazardous Material Information System, and Standard Level First Aid). North Shore personnel acquired a Paramount Resources Safe Work Permit prior to commencing fieldwork and a tailgate safety meeting was conducted at the beginning of each work day.

Prior to initiating any ground disturbance, a file review was completed and the proposed assessment area was swept by a third party company for the presence of buried facilities.

All ground disturbance documentation was peer reviewed prior to commencing the fieldwork. A hydrovac was not used prior to drilling, all above ground infrastructure was still in place and boreholes were advanced 5 m from any underground facilities.

3.2 Drilling Program

3.2.1 Borehole Drilling

Between February 6 and 8, 2017, 64 boreholes (17C01-17C03, 17BH01 to 17BH60 and 17HA01) were advanced as part of the drilling program (Figures 3 and 4). Boreholes were completed using a track-mounted drilling rig equipped with 15 cm solid-stem. One borehole was advanced using a hand auger. Boreholes were completed to a maximum depth of 6.0 metres below ground level (mbgl), depending on the assessment location and subsurface conditions. Delineation of potentially impacted areas was based on field screening, visual cues, and professional judgment. Vertical and horizontal delineations were completed to determine the spatial extent of the potentially impacted material. If potentially impacted material was identified during borehole logging, vertical delineation was completed by sampling parameters above the suspected impact zone and to a depth of 1.0 m below the suspected lowest point of contamination. Horizontal delineation was completed by advancing boreholes in 5.0 m horizontal increments in each direction (north, south, east, and west) until clean material, as determined by field screening and professional judgment, was identified. Select delineation samples were collected for laboratory analyses.

The GPS location, reference from a fixed point, and rationale of each borehole is included in the borehole logs in Appendix C. Borehole locations are shown in Figure 3 (Wellsite) and Figure 4 (DWDA).

3.3 Soil Sampling

Throughout the sample collection process, North Shore adhered to sampling procedures described in the Canadian Council of Ministers of Environment (CCME) Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites (CCME, 1993). Samples of the recovered soil were visually inspected for evidence of impact such as free product, staining, or discoloration. The outermost layer of the samples was trimmed using a soil tool to avoid cross-contamination. North Shore personnel wore a pair of clean, chemical resistant nitrile gloves for each soil sample collected as an added preventative cross-contamination measure.

Soil vapor concentrations were field screened for volatile hydrocarbon constituents using an RKI Eagle gas detector (RKI Eagle), calibrated with a 400 parts per million (ppm) concentration of hexane gas with the methane elimination switch turned on. Samples selected for vapor screening were placed

into plastic bags, sealed, agitated, and allowed to volatilize. Volatile organic compounds (VOCs) that accumulated within the headspace were then measured in ppm or percent of the lower explosive limit (LEL) and recorded on the borehole logs.

Soil samples were also field screened for salinity related parameters by measuring electrical conductivity (EC) using a Spectrum Technologies Inc. Field Scout Soil and Water EC Metre (EC Probe). Prior to sampling, the EC probe was calibrated with a 2.76 dS/m calibration solution. Once the soil on the auger had been trimmed, the EC probe was inserted directly into the soil media in order to obtain an insitu EC reading. The EC reading was allowed to stabilize for three seconds before being recorded in the field documents.

All soil samples were placed in sealable plastic bags for field screening organic vapors and inorganic analyses. Soil samples for volatile organic analyses included field preservation with methanol and glass jars with Teflon-lined lids for all other organic analyses. Jarred samples were packed tightly to minimize headspace, help prevent the loss of VOCs, and minimize biodegradation. All samples collected were labeled and placed in a cooler with ice or ice packs to maintain a temperature as close to 4°C as possible. Soil samples were transported to an accredited laboratory for analysis. Standard chain of custody protocols were followed during the transport of the samples.

Soil characteristics at each borehole location were described using classification procedures and terminology from The Canadian System of Soil Classification (Soil Classification Working Group, 1998). Borehole logs containing the soil profile descriptions are included in Appendix C.

3.4 Quality Assurance and Quality Control

3.4.1 Laboratory QA/QC

Soil samples collected during the February 6 to February 8, 2017 sampling event were submitted to AGAT Laboratory (AGAT) in Calgary, Alberta for analysis. The analytical suite was selected based on regulated compounds that are typically found on oil and gas sites.

AGAT is a Standards Council of Canada (SCC), ISO 9000 Series and ISO/IEC 17025 accredited laboratory and Canadian Association of Environmental Analytical Laboratories (CAEAL) accredited laboratory that uses ESRD recognized methods to conduct laboratory analyses. Method blanks, control standards samples, Certified Reference Material (CRM) standards, method spikes, replicates, duplicates, and instrument blanks are routinely analyzed as part of the QA/QC program at the laboratory. AGAT has indicated that analytical data is only released if it passes the laboratory QA/QC procedures. A summary of the QA/QC procedures adopted by AGAT during the analyses of samples for petroleum hydrocarbon concentrations, salinity parameters, and metals concentrations is included in Appendix D.

4 COMPARISON GUIDELINES

4.1 Assessment Guidelines

Selection of the appropriate set of guidelines is based on the texture of the dominant soil type along with current and potential future land use as determined in the assessment. Where both fine and

coarse grain strata are present, grain size is determined by the stratum governing horizontal and vertical migration to a receptor. Eleven soil samples collected from depths ranging from 0.0 to 4.9 mbgl were analyzed for particle size (75 micron sieve). All of the samples were reported to be fine-grained. As such, fine-grained guidelines were applied to the Site and DWDA.

As per the direction of Paramount, the guidelines for residential/parkland land use were applied to the Site and laboratory values were compared to the following:

- Soil regulated metals, glycol, benzene, toluene, ethylbenzene, and xylenes (BTEX), PHC fractions F1-F4 and polycyclic aromatic hydrocarbons (PAH) results were compared to the Canadian Council of Ministers of the Environment (CCME) - Tier 1 Soil Remediation Guidelines (CCME, 2017).
- Saturated paste boron and methanol results were compared to the AEP Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1 Guidelines; AEP, 2016a).
- Soil EC, Sodium Adsorption Ration (SAR) and pH values were compared to Environmental Guidelines for Contaminated Site Remediation (EGCSR, 2003) Environment Division. Government of the Northwest Territories (EGCSR, 2003).
- Soil EC and SAR values in the DWDA were compared to the Alberta Environment (AENV) 2012. Assessing Drilling Waste Disposal Areas: Compliance Options for Reclamation Certification or if control soils exceed these guidelines, to maximum control concentrations (SCAR Guidelines, AENV, 2001).

4.2 Background Control Characterization and Salinity Guidelines

During the Phase 2 ESA, three control boreholes (17C01 to 17C03) were advanced in undisturbed background locations to a maximum depth of 6.0 mbgl. The purpose of the control sampling was to characterize background soil conditions and to determine the generic salt remediation guideline values for the Site.

One topsoil and nine subsoil samples were collected from the three control locations and selected samples were submitted for detailed salinity and/or trace metal analyses.

All control detailed salinity analytical results complied with the EGCSR Guidelines. The onsite values were compared to the same general EC and SAR range. All control samples reported metals values that met the applicable remediation guidelines (Tables 1 through 3).

5 RESULTS OF FIELD INVESTIGATION

5.1 Stratigraphy

Based on the boreholes advanced during the drilling program, soil conditions generally consisted of clay over heavy clay to 4.5 mbgl.

5.2 Soil Results

Soil results for areas of concern are summarized in Sections 5.2.1 through 5.2.5. The laboratory analyses for soil samples are presented in Tables 1 through 5 along with the applicable comparison guidelines. A summary of the analytical testing procedures of the laboratory is presented on the laboratory certificates enclosed in Appendix D.

5.2.1 Well Centre Area

Five boreholes (17BH02 through 17BH06) were advanced to assess and delineate the well centre area to a maximum depth of 4.5 mbgl. The boreholes were advanced prior to abandonment; therefore the wellhead was still in place. Ground cover in the area was uniform and similar to the surrounding lease. VOC field screening results from the well centre samples were all less than 15 ppm. EC field screening results from well centre samples ranged from 0.32 to 0.75 dS/m.

Two samples (17BH02 1.3-1.5 mbgl and 17BH02 2.2-2.5 mbgl) were submitted for hydrocarbons analysis, detailed salinity and metal analyses. All analyzed parameters complied with the applicable guidelines.

5.2.2 Production Facilities Area

Five boreholes (17BH07 through 17BH11) and one hand auger borehole (17HA01) were advanced within former production facilities area. Boreholes were advanced to a maximum depth of 3.0 mbgl. VOC measurements from the soil samples were all less than 45 ppm and EC field screening values ranged from 0.03 to 0.87 dS/m.

Six samples were submitted for hydrocarbons, detailed salinity, metals, glycols and methanol analyses. One sample (17BH08 1.3-1.5 mbgl) reported an arsenic value of 13.0 mg/kg which exceeded applicable criteria. Sample 17BH10 0.8-1.0 mbgl reported a selenium value of 1.1 mg/kg which exceeds the guideline of 1.0 mg/kg. However, when the value is rounded to the equivalent number of significant figures as the guideline, the sample has a concentration equivalent to the applicable guideline. All other samples submitted for analysis met the applicable guidelines. Neither vertical nor lateral delineation of the arsenic exceedance were achieved.

5.2.3 Flare Stack/ Flare Knockout Area

Two boreholes (17BH12 and 17BH13) were advanced within the flare stack area and flare knockdown area. Boreholes were advanced to a maximum depth of 3.0 mbgl. VOC measurements were all less than 5 ppm. EC field screening results from the soil samples ranged from 0.21 to 0.84 dS/m.

Two samples were submitted for hydrocarbon analysis, detailed salinity, metals and PAH analysis, while one sample was submitted for glycols and methanol analysis. One sample (17BH13 0.3-0.5 mbgl) reported an arsenic value of 12.6 mg/kg which exceeded criteria. All other samples submitted for analysis met the applicable guidelines. Neither vertical nor lateral delineation were achieved.

5.2.4 Flare Pit Area

Eight boreholes (17BH01 and 17BH14 through 17BH20) were advanced to assess and delineate the flare pit area, to a maximum depth of 4.5 mbgl. VOC measurements were all less than 25 ppm and EC field screening values ranged from 0.21 to 1.12 dS/m.

Thirteen samples were submitted for hydrocarbons, eight samples were submitted for detailed salinity and metals, and twelve samples were submitted for PAH analyses. One sample (17BH01 2.8-3.0 mbgl) reported a benzene value of 0.010 mg/kg and ethylbenzene value of 0.83 mg/kg which exceeded criteria. Three samples reported total barium values of 631 mg/kg, 874 mg/kg and 1240 mg/kg, however met the fusion barium guideline based on the extractable barium result. Sample 17BH01 at 4.3-4.5 mbgl reported a selenium value of 1.2 mg/kg, which exceeds the Tier 1 guideline of 1.0 mg/kg. However, when the value is rounded to the equivalent number of significant figures as the guideline, the sample has a concentration equivalent to the applicable guideline. Two samples from 17BH01 and one sample from 17BH18 reported PAH exceedances. All other samples submitted for analysis met the applicable guidelines. Both vertical and lateral delineation were achieved.

5.2.5 Remote Drilling Waste Disposal Area

A total of 40 boreholes were advanced to identify and delineate the remote DWDA. Specifically, drilling waste material was identified in five boreholes (17BH52, 17BH53, 17BH55, 17BH57 and 17BH60). Four delineation boreholes (17BH54, 17BH56, 17BH58, and 17BH59) were advanced around the periphery of the suspected DWDA to a maximum depth of 4.5 mbgl. Borehole 17BH48 was advanced in the borrow pit area and 17BH21 was advanced in a disturbed area from the 2001 aerial photograph. Boreholes were advanced to a maximum depth of 4.5 mbgl. VOC measurements from the soil samples were all less than 100 ppm and EC field screening values ranged from 0.02 to 1.21 dS/m.

Fourteen samples from the drilling waste were submitted for hydrocarbons, eight samples were submitted for detailed salinity and five samples were submitted for metals analyses. Four samples exceeded applicable criteria for hydrocarbons (toluene, ethylbenzene and fraction F2). All five samples exceeded total barium criteria, however met the fusion barium guideline based on the extractable barium result. One sample (17BH25 at 3.0-3.5 mbgl) reported an arsenic value of 12.2 mg/kg, which exceeds the guideline of 12 mg/kg. However, when the value is rounded to the equivalent number of significant figures as the guideline, the sample has a concentration equivalent to the applicable guideline. All other samples submitted for analysis met the applicable guidelines. Neither vertical nor lateral delineation was achieved.

5.3 Quality Assurance/Quality Control

Quality assurance and quality control for analytical data was also assessed by comparing analytical results from select samples to duplicate samples obtained from the same sample location. Primary and duplicate samples were compared and the relative percent differences (RPD) were calculated.

RPD criteria have been applied to field duplicates in order to evaluate the precision of the results. If both the original and duplicate sample concentrations are greater than or equal to five times the laboratory detection limit for a given parameter, the RPD must be less than or equal to 40% (water)

and 60% (soils) (CCME, 2016). If the results lie outside of the range, they should be considered estimates only. The results of North Shore's QA/QC program are discussed in Section 5.3.1.

5.3.1 North Shore Environmental's QA/QC Program

Three soil sampling QA/QC measurements were conducted by duplicating soil samples 17C01 2.8 – 3.0 mbgl, 17BH02 1.3-1.5 mbgl and 17C03 0.3 – 0.5 mbgl (referred to as Dup A 2.8-3.0 mbgl, Dup B 1.3-1.5 mbgl and Dup C 0.3-0.5 mbgl). Laboratory comparisons reported good reproducibility for all benzene, toluene, ethylbenzene and total xylene (BTEX), petroleum hydrocarbon (PHC) (F1 – F4), particle size, metals, soluble ions, pH, EC and SAR values, with the exception of the Dup C SAR value. RPD value calculations and results for the QA/QC measurements are included in Tables 6 through 8.

6 SUMMARY AND CONCLUSIONS

Between February 6, 2017 and February 8, 2017, 63 drilling (solid-stem) boreholes and one hand auger borehole were advanced at the Site. Based upon the results of the Phase 2 ESA, the following conclusions were made:

- Background Controls - All soil samples reported EC levels, pH, SAR values and metal values which met the EGCSR Guidelines.
- Well Centre - Two samples were submitted for BTEX, PHC fractions F1-F4, detailed salinity, and metal analyses. All analyzed parameters complied with the applicable guidelines.
- Former Production area - Six boreholes were advanced within the former production areas. Six soil samples were submitted for BTEX, PHC fractions F1-F4, detailed salinity parameters, metal analysis, glycol analysis and methanol analysis. One sample exceeded criteria for arsenic. All other samples complied with the applicable guidelines.
- Flare stack/ Flare knockdown area - Two boreholes were advanced within the flare stack and flare knockdown area. Two soil samples were submitted for BTEX, PHC fractions F1-F4, detailed salinity parameters, metal analysis and PAH fractions. One sample was submitted for glycols and methanol analyses. One sample exceeded criteria for arsenic. All other samples complied with the applicable guidelines.
- Flare pit area - Thirteen samples were submitted for hydrocarbons, eight samples were submitted for detailed salinity and metals analysis, and twelve samples were submitted for PAHs analysis. One sample (17BH01 2.8-3.0 mbgl) reported a benzene value of 0.010 mg/kg and ethylbenzene value of 0.83 mg/kg which exceeded criteria. Two samples from 17BH01 and one sample from 17BH18 reported PAH exceedances. All other samples submitted for analysis met the applicable guidelines.
- Remote DWDA - Drilling waste material was identified in five boreholes (17BH52, 17BH53, 17BH55, 17BH57 and 17BH60). Borehole 17BH48 was advanced in the borrow pit area and 17BH21 was advanced in a disturbed area from the 2001 aerial photograph. Fourteen samples from the DWDA were submitted for hydrocarbons, eight samples were submitted for detailed salinity and five samples were submitted for metals analysis. Four samples exceeded applicable criteria for hydrocarbons (toluene, ethylbenzene and fraction F2). All other samples met applicable guidelines.

Based on a review of the analytical data, field observations, and field screening information from the Phase 2 ESA, several analyzed soil parameters did not meet the applicable remediation guidelines. Additionally, soil impacts that were identified during the Phase 2 ESA were not fully delineated.

7 DISCLOSURE

North Shore Environmental Consultants Inc. (North Shore) has prepared this report taking into account government regulations available at the time of the assessment. North Shore has not made an independent verification of historical or analytical results provided by third parties and therefore makes no assurances regarding the accuracy of such information. It has assumed such information is correct. Where indicated or implied the conclusions are based on visual observation and/or analytical testing conducted at the time of the assessment. The conclusions do not apply to any areas of the site not investigated.

This report is intended for the exclusive use of the company, organization, or individual to whom it is addressed and may not be relied upon by any third party without the express written permission of North Shore. The investigation and reporting has been conducted with a reasonable level of attention and skill, in accordance with standards prevailing in the environmental consulting profession at the time of report date in the location in which the report was prepared.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. North Shore accepts no responsibility for damages, if any, suffered by any third party as a result of the use of this report or any decisions made or actions based on this report.

8 CLOSURE

North Shore appreciated the opportunity to work on this project. If we can provide clarification of any part of this report, please contact the undersigned at (780) 467-3354.

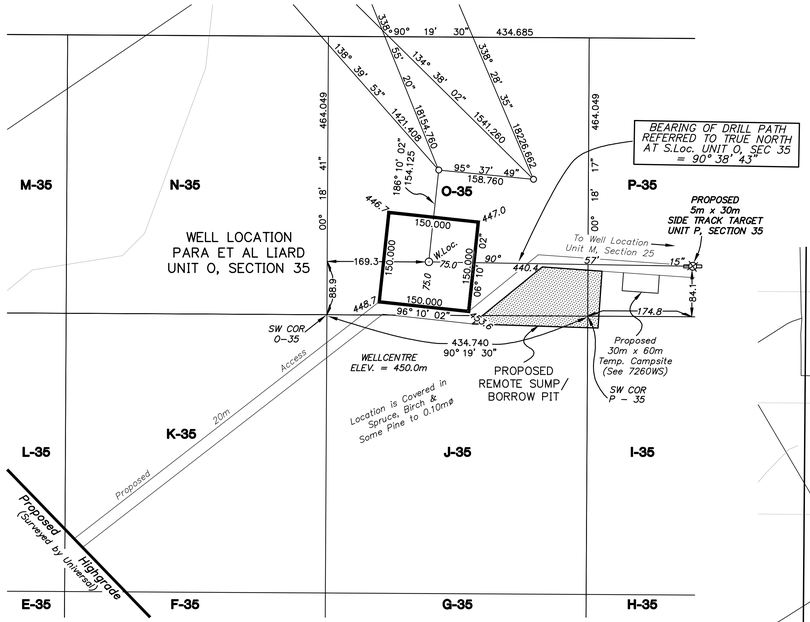
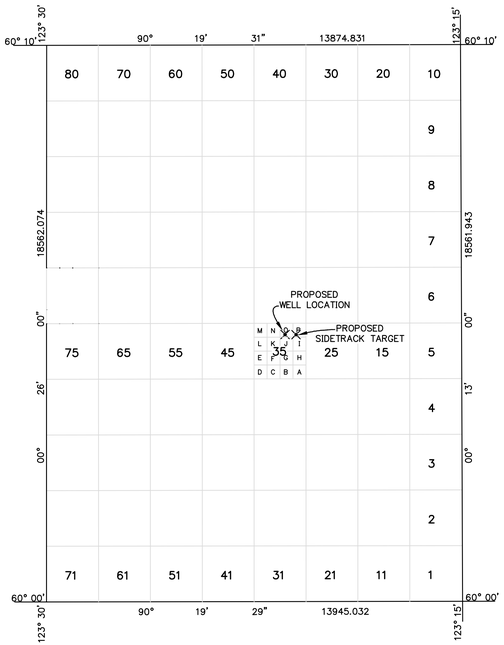
APPENDIX A

Survey Plan



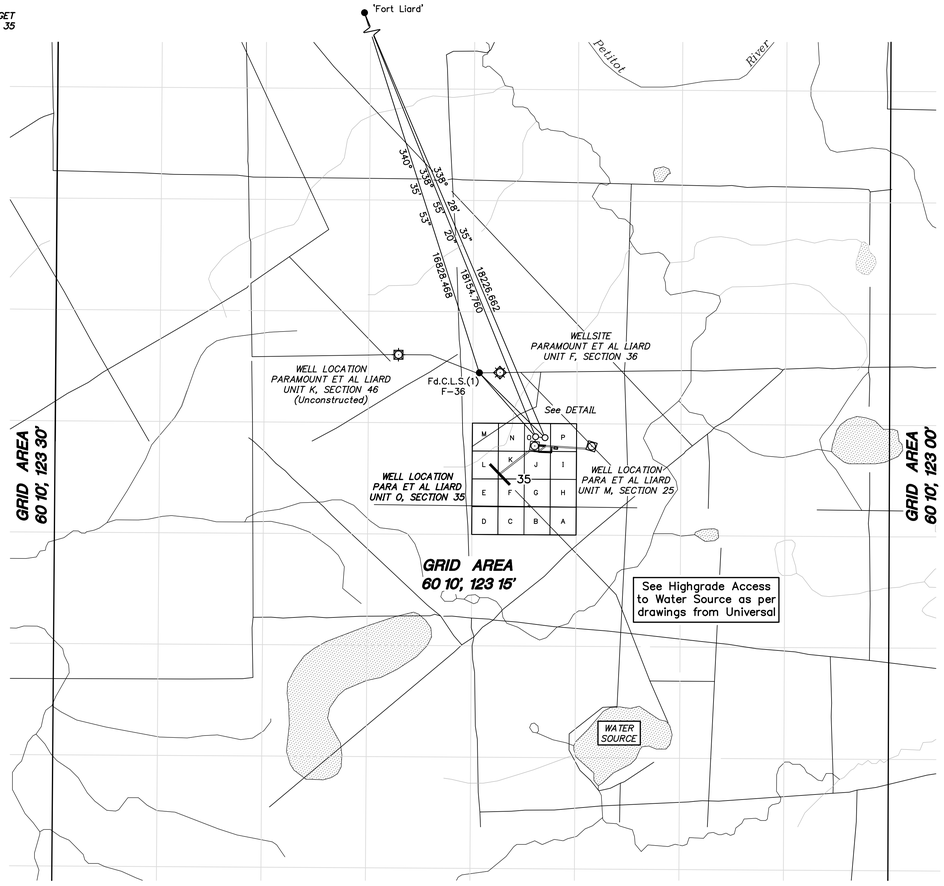
DETAIL
UNIT O, SECTION 35
SCALE 1:5,000



GRID AREA 60°10', 123°15'
SCALE 1:100,000

AREAS REQUIRED:

WELLSITE:	150mx150m =	2.25 ha.
REMOTE SUMP & BORROW PIT:	VARIABLE =	1.51 ha.
TOTAL:		3.76 ha.



All coordinates shown are on 1927 North American Datum.
Wellsite control established using differentially corrected GPS observations.
Final coordinate values for control were transformed from NAD83 datum to NAD27 datum using National Transformation Version 2 program.
Geodetic Survey of Canada published coordinate values for monument 'Fort Liard' were held fixed. Adjusted values for Fd.CLS(1) F-36 Grid Area 60°10', 123°15' and comparison to published coordinates are shown below.

GEOGRAPHIC AND UTM COORDINATES, (1927 NAD)				
Station	Latitude	Longitude(W)	Northings	Eastings
CONTROL MONUMENTS				
Fort Liard (Pub. & Fixed)	60°13'59.011"	123°28'31.881"	6677255.686	473662.363

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : R.O. BLACKALL, CLS
JUNE, 1999.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995353. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mkr. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic of Canada Monument 'Fort Liard' Elev. = 216.299m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, R.O. Blackall, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

R.O. Blackall, CLS

Sworn before me at Fort St. John, this 06th day of July, 1999.

THIS SURVEY WAS EXECUTED DURING THE PERIOD
JUNE 25th TO JUNE 27th, 1999. BY R.O. BLACKALL, CLS

SOIL ANALYSIS REVIEWED BY: Melinda Guay, Technical Reviewer

TRACE ORGANICS REVIEWED BY: Melinda Guay, Technical Reviewer

DATE REPORTED: Mar 03, 2017

PAGES (INCLUDING COVER): 44

VERSION*: 5

Should you require any information regarding this analysis please contact your client services representative at (780) 395-2525

*NOTES

VERSION 5:Monoethylene glycol has been revised to say: ethylene glycol - February 13th 2017 CS.

Version 2 supersedes version 1 issued on February 13th 2017. Methanol added to samples: 976, 983, 985, 992, 999, 1006 and 013 - February 16th 2017 CS.

Version 3 supersedes version 2 issued on February 16th 2017. Added PAH to samples: 015, 022, 027, 028, 029, 044, 050, 051, BTEX/F1-F4 to: 027, 028, 029, extractable and fusion barium to samples: 953, 956, 037, arsenic and selenium to samples: 931, 932, 944, 945 and 946. Sample: 958 was also re-prepped and re-ran for benzene and confirmed. However value has been updated from 0.0007 to <0.005 - February 23rd 2017 CS.

Version 4 supersedes version 3 issued on February 23rd 2017. Added - total barium to samples: 930, 931, 932, 943, 945, 947, added total arsenic to samples: 930, 943, 947 and BTEX/F1 to samples: 050 and 051 - March 3rd 2017 CS.

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8180932-8181054 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8181050-8181051 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
Total C6 - C10 results are corrected for BTEX.
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
Linearity is within 15%.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

Petroleum Hydrocarbons (BTEX/F1-F4) in Soil (CWS)

DATE RECEIVED: 2017-02-09

DATE REPORTED: 2017-03-03

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8180953-8180978 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

8180983 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.

nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
C>10 – C16 (F2- Napthalene) is a calculated parameter. The calculated value is F2 - Napthalene (if requested).
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (if requested).
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
Extraction and holding times were met for this sample.

8180987-8181054 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.

Polyaromatic Hydrocarbon Analysis in Soil

DATE RECEIVED: 2017-02-09

DATE REPORTED: 2017-03-03

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8180953-8181051 Results are based on the dry weight of the sample.
Based on GC/MS target ion analysis.
Isomers Benzo(b)fluoranthene and Benzo(j)fluoranthene have the same GC retention time and are reported as the sum of the two.
B[a]P TPE, IACR (Coarse) and IACR (Fine) are calculated parameters. They are calculated according to the Alberta Tier 1 Soil and Groundwater remediation Guidelines, May 23, 2014. Note that if the analysis returns non-detects for a parameter, ½ the detection limit is entered into the formulas.

Comments: If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated
If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.

Comments: If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.
If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

Workorder No: 17N185998

Samples Damaged: Yes (No) If YES why?

- ALL samples with terracores submitted were NOT properly labeled. The vials & jars for BTEX/F1-F4 were not individually labeled. Terra core sets were submitted in a bag that was labeled with sample ID.

General Comments: Assign Glycols in place of Methanol - 6x 120mL jar sent to Calgary for Glycols & 1x 120mL jar sent for BTEX/F1-F4 & Glycols. sample 1008C - Duplicate vial for BTEX/F1 rec'd without sample in vial - only MeOH present. sample 1037B/C/D - COC ID is BH18 2.2-2.5, bag containing vials & jar reads BH17 2.2-2.5 - Logged following COC ID as 1037A/E/F match COC and there are no BH17 IDs listed on COC.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8191138-8191199 If sodium results in mg/L are less than detection, SAR is non-calculable and is reported as 0.
Sodium Adsorption Ratio is a calculated parameter. The calculated value is the ratio of the sodium concentration in mmol/L over the square rooted sum of the calcium and magnesium concentrations in mmol/L.
Theoretical Gypsum Requirement is a calculated parameter. The calculation is from “A Comparison of Methods for Gypsum Requirement of Brine-Contaminated Soils”, Canadian Journal of Soil Science, 1998.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8191180-8191206 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

Ethylbenzene-d10 (BTEX)	%	50-150		59	70	88	66	67	68	74	66
o-Terphenyl (F2-F4)	%	50-150		98	95	96	94	99	101	90	94

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

8191147-8191199 Results are based on the dry weight of the sample.
The C6-C10 (F1) fraction is calculated using toluene response factor.
The C10 - C16 (F2), C16 - C34 (F3), and C34 - C50 (F4) fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons (F4g) are not included in and cannot be added to the Total C6-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
Total C6 - C50 results are corrected for BTEX and PAH contributions (if requested).
Quality control data is available upon request.
Assistance in the interpretation of data is available upon request.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
The chromatogram returned to baseline by the retention time of nC50.
Extraction and holding times were met for this sample.
C6 –C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.

APPENDICES

I. Borehole Logs, Tables, and Drawings from North Shore Preliminary Stage 2 Report
II. Historical Borehole Logs
III. Water Well and Water Body Search Results

1. INTRODUCTION

At the request of Paramount Resources Limited (Paramount), SynergyAspen completed a Desktop Remediation™ (DTR) review of historical environmental site assessment information and data for the Paramount former wellsite *PARA ET AL* O-35 - 60-10-123-15, with Well Identification number 1868 (the Site). The Site is in the South Liard field of the Northwest Territories.

The scope of work for the DTR involved reviewing and assessing available analytical data to determine the applicability of various guidelines based on land uses and receptors at the Site. Recommendations for remediation at the Site will be provided based on regulatory requirements.

The areas of potential environmental concern (APECs) identified in the 2017 Phase 1 ESA for the Site by North Shore Environmental Limited (North Shore) were the Well centre; production facility areas and flare stack areas; former spill areas at Well centre and storage tank areas; the remote drilling waste disposal area (DWDA) in O-35; and the potential drilling flare pit area (North Shore, 2017a). The areas of environmental concern (AECs) identified in North Shore's 2017 Phase 2 ESA for the Site were the Production Facilities area and Flare Knockout area for marginally elevated arsenic; the Flare Pit area and Remote DWDA for hydrocarbons; and the Flare Pit area for polycyclic aromatic hydrocarbons (PAHs) (North Shore, 2017b).

2. CURRENT SITE DESCRIPTION

The well was drilled to a depth of 2121 meters between November 2 and December 4, 1999, with the rig release on December 29, 1999. The well produced natural gas from 2000 to 2005 and was abandoned in April 2008. The Site was winter-access, in the South Liard field, approximately 18 kilometres (km) southwest of Fort Liard, Northwest Territories (NT). The Site location is presented on Drawing PAR6211-001.

The Site was approximately 150m x 150m, with a proposed borrow pit/remote sump adjacent east of the Site, and a 30m x 60m campsite east of the borrow pit/remote sump. Site details and surrounding land uses are shown on Drawing PAR6211-002 and PAR6211-003. Table A below summarizes general information regarding the Site's location, topography, hydrogeology, and surrounding land uses.

TABLE A: Summary of General Information

Item	Description
Site Latitude & Longitude	60° 04' 47.73" N, 123° 21' 29.33" W
NTS Map	O-35 - 60°-10'-123°-15'
Well ID #	1868
Land Owner(s)	Crown
Drilling Dates	November 2 to December 4, 1999; RR December 29, 1999
Total Depth	2121m
Site Description & Size	Site dimensions are approximately 150 m x 150 m square, with access from the west.
Site Facilities	Wellhead was located at the centre of the Site; remote sump/borrow pit adjacent east; 30x60m campsite east of the remote sump area along seismic line
Topography:	
Regional Surface Grade	The regional grade is gently sloping northeast (0-1%) towards a tributary of the Liard River
On Site Drainage	The lease slopes northeast (0-1%) based on the survey details
Surface Cover	In 2017 vegetation included willow, spruce, pine, aspen, and alder, consistent with off-site
Geology	Bedrock geology consists of Fort Saint John Group, which is comprised of mudstone, siltstone, Shale and fine clastic sedimentary rocks, sandstone, coal and conglomerates [BCGS online map resource].
Hydrology & Hydrogeology:	
Nearest Surface Water	Government of NWT ATLAS website shows no water bodies within 500m of the Site. A borrow pit with standing water is visible ~800m east at the M-25 site.
Water Wells	Government of NWT ATLAS website shows no water wells within 500m of the Site (Appendix III).

Item	Description
Depth to Groundwater	Unknown
Groundwater Flow	Unknown but likely to the northeast towards the unnamed tributary of the Liard River
Surrounding Land Use (Site)	
North	Mixed wood Boreal forest
East	Mixed wood Boreal Forest
South	Mixed wood Boreal Forest
West	Mixed wood Boreal Forest

3. HISTORICAL REVIEW

The scope of this report included a review of available historical environmental site assessment (ESA) information for the Site. Findings from the review of the available reports are summarized below.

3.1 Phase 1 ESA - 2017

North Shore completed a Phase 1 ESA on the Site, published in March of 2017. The Phase 1 ESA indicated the well was a producing well from 2000 to 2005. Infrastructure at the Site included the wellhead, flare knockout drum with vent; pipeline; flowline; meter run; separator and methane pump building; pig launcher, and methanol tank within a containment berm. A remote sump/borrow pit was located east of the Site, with a campsite east of the remote sump area. Based on Compliance Option #2 checklist, the Remote DWDA failed for salt and barite loading calculations for the drilling waste disposal, and the Remote DWDA requires assessment (North Shore, 2017a).

Three spills were associated with the Site: 1000L of diesel fuel from a storage tank; a small amount of staining around the wellhead; and 800L of waste along the access road during the rig move (North Shore, 2017a). Areas of Potential Environmental Concern noted in the Phase 1 ESA were the well centre; production facility/flare stack area; former spill areas at well centre and tank areas; Remote DWDA at O-35; and a potential drilling flare pit area (North Shore, 2017a).

3.2 Phase 2 ESA - 2017

North Shore completed a Phase 2 ESA on the Site, published in May of 2017. The Phase 2 ESA investigated the APECs identified in the Phase 1 ESA for the Site and consisted of 63 boreholes and one hand-auger advanced at the Site and remote DWDA. Analytical results from the Phase 2 ESA were compared to the following guidelines: Canadian Council of Ministers of the Environment (CCME) 2017 Tier 1 Soil Remediation Guidelines; the 2003 Northwest Territories Environmental Guidelines for Contaminated Site Remediation; and the Alberta Tier 1 Soil and Groundwater Remediation Guidelines (North Shore, 2017b). Results showed impacts withing the subsurface (>1.5mbgs) at the Site: elevated arsenic in two samples from the Production Facilities area, and the Flare Knockout area; hydrocarbons and PAHs noted in the flare pit area; and hydrocarbons noted in the Remote DWDA (North Shore, 2017b).

4. SUMMARY OF SITE SOIL CONDITIONS

Based on a review of historical reports, SynergyAspen developed a list of areas of environmental concern (AECs) for the Site. The AECs, along with contaminants of concern (COCs) and associated regulated parameters, are shown on Table B below. The AEC is shown in Drawing PAR6211-002.

TABLE B: AECs and Associated COCs in Soil

AEC Label	AECs	Impacted Borehole(s)	COCs (depth)
A	Flare Pit Area	17BH01, 17BH14, 17BH18	Benzene and Ethylbenzene (2.8-3.0mbg) Naphthalene and Fluorene (2.8-3.0mbg), Phenanthrene (1.3-3.0mbg)
B	Remote DWDA	17BH48, 17BH52, 17BH57	Toluene (1.7-1.9mbg) Ethylbenzene and F2 PHC (1.5-3.5mbg)
C	Production Facilities	17BH08	Arsenic (1.3-1.5mbg)
D	Flare Knockout	17BH13	Arsenic (0.3-0.5mbg)

Soil Stratigraphy

Three background boreholes assessed at the Site in the North Shore 2017 Phase 2 ESA. Soil stratigraphy at background boreholes was consistent with firm clay layer from surface to between 1.0 and 3.0mbg, overlying hard clay to 6.0mbg, the total depth of assessment (North Shore, 2017b).

The stratigraphy at the Flare Pit area APEC was shown in boreholes 17BH01 and 17BH14 through 17BH20. Stratigraphy was described similar to the controls with firm clay to around 2.5mbg, overlying hard clay to 4.5mbg. Organic material was noted mixed in 17BH18 at 2.6-3.2mbg leading to an increase in volatile organic compounds measured at that depth.

The stratigraphy at the remote DWDA APEC was shown in boreholes 17BH48 through 17BH60. Stratigraphy in 17BH48 was similar to the controls with undisturbed firm clay to around 2.2mbg, overlying hard clay to 4.5mbg; the soil profile was noted as “wet due to low area” (North Shore, 2017b). Stratigraphy in 17BH52 was described similar to the controls with undisturbed firm clay to around 1.5mbg, overlying hard clay to 4.5mbg; a layer of wet “potential drilling waste” was noted from 1.5 to 2.0mbg in the borehole. Stratigraphy in 17BH57 was described similar to 17BH52 with undisturbed firm clay to around 2.2mbg, overlying hard clay to 4.5mbg; a layer of wet “potential drilling waste” was noted from 2.2 to 3.5mbg in the borehole (North Shore, 2017b).

The stratigraphy at the Production Facilities and Flare Knockout AECs was shown in boreholes 17BH08 and 17BH13 and was like the controls with firm clay to 2.2 or 3.0mbg, overlying hard clay to 4.5mbg.

Hydrogeology

There were 9 soil samples collected at varying depths from the background boreholes for grain size analysis by sieve pan. The sieve method provides the percentage split between coarse and fine-grained material based on retention on a 75µm mesh screen sieve. The grain size analysis results ranged from 3% to 33% retention on the sieve, indicating fine-grained material was dominant throughout the soil profile at the Site (North Shore, 2017b).

The shallow subsurface regional geology of the area north of Maxhamish Lake was reviewed through borehole logs from Phase 2 ESAs completed at four sites in the region. The borehole logs from the following sites were reviewed:

- PARA ET AL MAXHAMISH B- 21-K/094-O-14 (WA#03717) (North shore, 2017c)
- PARA ET AL MAXHAMISH B- 043-K/094-O-14 (WA#12563) (North shore, 2017d)
- PARA ET AL MAXHAMISH B- 083-K/094-O-14 (WA#13773) (North shore, 2017e)
- PARA ET AL MAXHAMISH A-96-J/094-O-14 (WA#13772) (North shore, 2017f)

The sites were located respectively approximately 17 kilometres (km) south-southeast, 15km south-southeast, 11.5km south-southeast, and 13.5km southeast of the O-35 Site. Soil stratigraphy at the b-21-K/94-O-14 site was topsoil and silty-clay overlying clay subsurface. Delineation boreholes around the site showed clay overlying hard clay, with minor occurrences of sandy loam. Hydraulic conductivity testing was completed at the site from 3 groundwater monitoring wells installed during the Phase 2 ESA: hydraulic conductivity values ranged from $1.0x10^{-9}$ meters per second (m/s) to $2.0x10^{-10}$ m/s, as expected from the soil type at the site (2017c).

The soil profile at background locations at the b-043-K site showed loam surface soil to 0.2m, overlying clay-loam soil to approximately 3.0mbg, followed by silty-clay-loam to 4.5mbg, and silty-loam to 6.0mbg. All samples from various depths submitted for grain-size analysis through sieve analysis showed fine-grained soils dominant in the soil profile at the site (North Shore, 2017d).

The borehole logs from background locations at the b-083-K and A-96-J sites showed consistent profiles with loam surface soil to 0.2mbg, followed by clay to approximately 3.0 mbg, overlying “hard clay” to 6.0mbg, the maximum depth of investigation; a layer of silty-clay was noted in one borehole from the a-069-J site. A sand layer was noted in one borehole from 2.4-2.8 mbg at the b-083-K site. All samples submitted for grain-size analysis through sieve analysis from both sites showed fine-grained soils dominant in the soil profile at the sites (North Shore, 2017e,f). Copies of the reviewed borehole logs and figures are provided in Appendix I and II.

From the Phase 2 ESA for the Site and hydraulic conductivity information the region, there was a sufficient minimum confining layer present between the Site and a deeper regional aquifer. Hydraulic conductivity values of the deeper soils at the Site would be expected to be low due to the hard clay soil at the Site. Therefore, drinking water (DW) standards would not apply at the Site within the shallow soils, but would apply in the deeper aquifer unit, if present. At the time of the assessments there were no water wells, water bodies, or residences within 500m of the Site.

5. ENVIRONMENTAL REGULATORY FRAMEWORK

Numerical soil standards for evaluating the results of the Phase 2 ESA were based on the CCME 2018 Canadian Environmental Soil Quality Guidelines (the CESQ), and the Northwest Territories Environmental Guidelines for Contaminated Site Remediation (the Environmental Guidelines) (Minister of the Environment and Natural Resources [ENR], 2003). The selection of applicable guideline limits in both documents are dependent upon site conditions, applicable receptors at a site, and relevant exposure pathways. From the land use definitions and soil depth considerations in the guideline documents, the Residential/Parkland land use was used to evaluate the 2017 Phase 2 ESA results for the Site.

For assessment of the available data for the O-35 Site, the *Tier 1 – Criteria-based Approach* described in the Environmental Guidelines and the CESQ guidelines were used to determine the applicable hydrocarbon and PAH concentration limits for the Site.

For the evaluation of receptors and pathways related to groundwater protection, water use considered proximity to potable water and aquatic receptors, current and potential future use of groundwater aquifers as water sources, and the potential for groundwater extraction based on the hydraulic conductivity of the shallow regional soils.

From the Site information in Section 2, there were no groundwater wells, water bodies, or residences within 500m of the Site. Based on the rationale in Section 4 regarding low hydraulic conductivity due to fine-grained soil in the region, and the lack of water bodies, water wells or residences in proximity to the Site, the Protection of Potable Groundwater, Protection of Freshwater Aquatic Life, and Protection of Livestock Watering pathways would not be operative at the Site.

The following receptor pathways were determined to be applicable at the Site:

For analytical results from soil samples <1.5mbg:	For analytical results from soil samples >1.5mbg:
• Direct Contact; and • Ecological Soil Contact.	• Ecological Soil Contact; • Nutrient and Energy Cycling.

5.1 Guideline Derivation

From the evaluation of receptor pathways at the Site, as described in the ENR *Tier 1 Criteria-based Approach,* the Protection of Potable Groundwater pathway was not applicable at the Site. Therefore, the guideline limit for F2 PHC in fine-grained sub-surface soil for Residential land use was determined to be 2200 milligrams per kilogram (mg/kg), based on the Ecological Soil Contact pathway (ENR, 2003). The guideline limit in the Environmental Guidelines for benzene was 0.5mg/kg; for toluene was 0.8mg/kg; and for ethylbenzene was 1.2mg/kg.

Guideline limits for PAHs at the Site were based on the ENR 2003 guidelines for Residential land use, and the CCME 1997 *Recommended Canadian Soil Quality Guidelines* (CCME, 1997). The guideline limits were based on the elimination the Protection of Freshwater Life pathway at the Site, and the CCME recommendation in cases where PAH guidelines were not provided, to revert to the 1997 provisional Soil Quality Guidelines. Therefore, the applicable guideline for naphthalene at the Site was determined to be 0.6mg/kg based on soil contact, for fluorene was determined to be 0.25mg/kg, and for phenanthrene was determined to be 5.0mg/kg.

6. COMPARISON OF DATA

Based on the 2017 Phase 2 ESA, soil analytical results were compared to the applicable guideline limits with respect to the operative receptor pathways at the Site. Table C below shows the historic Site soil data compared to applicable soil guidelines at the Site:

TABLE C: Soil Quality Guidelines applicable at the Site (mg/kg)

Parameter	2017 Analytical Results (North Shore, 2017b)	ENR 2003 Residential/ Parkland	ENR 2003 Residential/ Parkland*
Arsenic	12.6 - 13.0	12	-
F2	297 - 733	250	2200
Benzene	0.01	0.5	-
Ethylbenzene	0.23 – 0.83	1.2	-
Toluene	0.12	0.8	-
Naphthalene	0.032 - 0.823	0.6	-
Fluorene	0.41	0.25	-
Phenanthrene	0.07 – 0.48	5.0	-

*Guideline for Ecological Soil Contact, subsurface samples >1.5mbg

As well, further discussion regarding the applicability of various guidelines with respect to expected land uses, available receptors, and site-specific conditions is included in the next section.

7. RESULTS AND CONCLUSIONS

Analytical soil data from the 2017 North Shore Phase 2 ESA were compared to current ENR and CCME guidelines applicable to the Site. A discussion of the results is presented below.

7.1 Soil Results

7.1.1 Arsenic

Two samples at the Site, from the Production Facilities area and Flare Knockout area had concentrations of arsenic marginally above the guideline level. The CCME Residential/Parkland guideline for Arsenic in soils was based on protection of human health from soil ingestion with a limit of 12 mg/kg, and the protection of environmental health, with a soil contact limit of 19 mg/kg (CCME, 1997). The 1991 CCME interim guideline for arsenic was 50 mg/kg.

Referring to CCME fact sheets, *Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health*, the fate and behaviour for arsenic according to the site-specific conditions and application of standards is as follows:

- If a spill or release led to the exceedances for arsenic, contamination from other chemicals, including hydrocarbons, salinity, and metals would be expected. As no residual hydrocarbon, salinity, or metals parameters were indicated in the analytical results for the two samples, it was unlikely that the elevated arsenic concentrations were the result of a spill or release.
- The Site is not currently occupied by humans and the Site is unlikely to be occupied by humans in the future. While the arsenic concentrations in the two soil samples were above the guideline limit for soil ingestion and soil contact, the depth of the impacts at >0.3mbg was below the depth that would require mechanical excavation to expose impacted soil. Therefore, soil ingestion and soil contact pathways would not be operative at the Site.
- If removal of the two elevated arsenic exceedances was undertaken, the heavy equipment used to excavate the soil would likely cause significant impacts to the reclaimed condition at the Site compared to the minimal risk to humans and the environment that may be imposed by the arsenic remaining *in-situ*.

- ENR Guidelines for soil in and around the Yellowknife area noted natural occurrences of arsenic up to 300mg/kg, with the average in and around the Yellowknife area of 150mg/kg (ENR, 2003). The ENR determined a remediation objective of 160mg/kg for Residential land use in Yellowknife area soils, based on accessibility (soil ingestion and soil contact) to the yard for 2 hours per day, 5 months of the year (ENR, 2003). Access to the Site by the public is currently less than 5 months of the year for a maximum concentration of 13.0mg/kg in soil. The Site is in a remote setting where access is limited to helicopter transport or winter roads, and toddlers or the public are not expected on a regular basis at the Site. The Site aligns with Industrial land uses, in contrast to the models for residential/parkland areas.

In addition, arsenic concentrations in the background/control boreholes show increasing arsenic with increasing depth. Based on the above rationale, the arsenic exceedances detected at the Site did not pose a risk to human and ecological receptors at the Site.

7.1.2 F2 Petroleum Hydrocarbons

Exceedances for F2 PHC were noted in three soil samples from the subsurface of the Remote DWDA, at depths of 1.5 to 3.5mbg. Concentrations ranged from 297 to 733 mg/kg in the three samples. Based on the summary of site conditions in Section 4, the result was compared with the ENR guideline for PHC in subsurface soils (>1.5mbg) with the Protection of Groundwater pathway removed, resulting in a guideline limit for subsurface soil of 2200 mg/kg. All samples with elevated F2 PHC results were below the applicable ENR guideline, therefore the results do not present a risk to human or ecological receptors at the Site.

7.1.3 Benzene and Toluene

Single exceedances for benzene and toluene were noted in the subsurface of the Flare Pit area and Remote DWDA respectively. The concentration of benzene, at 0.01 mg/kg in the Flare Pit area at 2.8-3.0mbg, and the toluene concentration of 0.12 mg/kg in the Remote DWDA at 1.5-2.0 mbg were compared to the ENR 2003 guideline limits in fine-grained subsurface (>1.5mbg) soil; the limit for benzene was 0.5 mg/kg, and for toluene was 0.8 mg/kg (ENR, 2003). The results for the benzene and toluene concentrations were below the applicable ENR guideline. Therefore, the single benzene and toluene exceedances noted in the subsurface do not pose a risk to human or ecological receptors at the Site.

7.1.4 Ethylbenzene

Exceedances for ethylbenzene were noted in the subsurface at the Flare Pit area and Remote DWDA. The concentration in the Flare Pit area sample was 0.83 mg/kg at 2.8-3.0 mg/kg, and in the Remote DWDA ranged from 0.23 to 0.25 mg/kg in three samples, at depths from 1.5 to 3.5mbg. The results compared to the ENR 2003 guideline limit for ethylbenzene in fine-grained subsurface (>1.5mbg) soil, with a limit of 1.2 mg/kg. The results from all samples were below the ENR guideline applicable to the Site. Therefore, the ethylbenzene exceedances noted in the subsurface at the Site do not pose a risk to human or ecological receptors.

7.1.5 Polycyclic Aromatic Hydrocarbons

Four subsurface soil samples from the Flare Pit area had concentrations of naphthalene, fluorene, and phenanthrene above the guideline limits. One sample, from 17BH01 at 2.8-3.0 mbg, had exceedances for the three PAHs; one sample from 17BH14 at 2.8-3.0mbg had an exceedance for naphthalene; and single samples from 17BH01 at 1.3-1.5mbg, and 17BH18 at 2.2-2.5mbg, had exceedances for phenanthrene only. The results were compared to guideline limits with Protection of Freshwater Life pathway removed at the Site, based on the rationale provided in Section 4.

Following revision of the guidelines, one of the two exceedances for naphthalene at 2.8-3.0m was above the revised guideline limit of 0.60mg/kg: the sample from 17BH01 at 2.8-3.0mbg with a result of 0.823mg/kg. However, the exceedance was >2.8mbg, below the depth at which mechanical excavation would be required to expose receptors to the soil.

The single exceedance for fluorene, at 0.41 mg/kg was above the applicable guideline limit of 0.25 mg/kg; however, the exceedance was at >2.8mbg, below the depth at which mechanical excavation would be required to expose receptors to the soil.

The exceedances of Phenanthrene in the 3 samples: 0.07 mg/kg at a depth of 1.3-1.5 mbg; 0.48 mg/kg at a depth of 2.2-2.5 mbg; and 0.08 mg/kg at a depth of 2.8-3.0 mbg, were in 3 different boreholes, with no other boreholes showing evidence of elevated PAHs. The results were compared to the guideline limit for phenanthrene with the Protection of Freshwater Life pathway eliminated based on information on Section 4. The results were all below the guideline limit of 5.0mg/kg for phenanthrene, therefore the exceedances did not pose a risk to receptors at the Site.

7.2 Conclusions

Based on a review of results from the 2017 Stage 2 PSI at the Site, SynergyAspen determined that the hydrocarbon and PAH exceedances at the Site were reasonably expected to pose no risk to receptors at the Site. Rationale for the determination was based on the applicable guideline limits with receptor pathways removed; the lack of associated contaminant impacts; low regional soil infiltration rates; naturally occurring metals in the soil profile; and the depth of the samples. The rationale regarding exceedances at the Site were considered to meet the ENR and CCME requirements for determining the risk to receptors at the Site.

8. CLOSURE

Based on the evaluation of the available historic data, no further environmental work is required at the Site prior to submission of the report to the ENR.

Thank you for the opportunity to conduct the work presented herein. If you have any questions or comments, please do not hesitate to contact the undersigned at 250-785-1030.

Respectfully Submitted,

SYNERGYASPEN ENVIRONMENTAL INC.

10. USER RELIANCE AND GENERAL LIMITATIONS

10.1 User Reliance

SynergyAspen Environmental Inc. (SynergyAspen) prepared this report for the sole use of Paramount Resources Limited (the Client). The Client was privy to the establishment of this project's scope and is aware of its terms and conditions.

Should the Client submit this report to a regulatory authority, the regulatory authority may rely on the results within the context of the document's General Limitations for the purpose of determining whether the Client is meeting (has met) its requirements concerning applicable environmental regulations.

Third party reliance is subject to the scope of work agreed upon by SynergyAspen and the Client and is only suitable within the limitations of the project/document. The activities detailed herein were performed for the Client and this document may not be appropriate for the purposes of a relying party. Application of this document for aims beyond those practically intended by the Client and SynergyAspen is at the exclusive risk of the user. SynergyAspen does not accept legal responsibility for any damages toward any third party as a result of the application, use of, or any conclusion drawn based on this report.

As far as the nature of these investigative activities involves professional opinion, SynergyAspen offers no assurance that the results contained herein support a particular course of action. The investigative activities may have included the application of judgment to scientific principles; hence certain results of this work may be based on subjective interpretation. Professional opinions expressed herein are derived from the specifics currently available within the confines of the existing information, scope of work, budget, and schedule.

10.2 General Limitations

The results and conclusions herein were developed according to the degree of care and skill generally exercised by contemporary environmental professionals within similar conditions and localities. The findings herein are somewhat reliant upon information provided by others. If any of the information is erroneous, amendments to the results, conclusions, and recommendations may be required.

The results, conclusions and recommendations SynergyAspen presents herein represent SynergyAspen's best professional judgement according to the site conditions and on available information during preparation of this report. They were determined explicitly for this site and are somewhat reliant upon visual observation of the site, subsurface investigation at specific locations and depths, and select analysis of specific materials (as detailed herein).

While this assessment has attempted to identify all areas of potential environmental concern at the Site, it is possible that other areas of potential environmental concern may have escaped detection due to imprecise government records, undocumented historical environmental accidents, or other undocumented activities that resulted in contamination.

SURVEYED FOR
PARAMOUNT RESOURCES LTD.

BY : R.O. BLACKALL, CLS
JUNE, 1999.

LEGEND
UTM coordinates are computed for Zone 10, central meridian 123° W.
Bearings were derived from differentially corrected GPS Observations and are referred to Meridian 123° W.
Distances are expressed in metres and decimals thereof.
Distances shown in traverse are measured distances reduced to the horizontal at general ground level.
For the computation of coordinates measured distances have been reduced to the UTM plane by multiplying them by an average combined scale factor of 0.9995353. Coordinates were then adjusted to fit the control.
Distances shown on grid area subdivisions are UTM plane.
Authorized control monuments found ..... ●
Monuments placed ..... ○
Mar. denotes metal marker post 2.0m long placed 0.30m N.
Elevations were derived from Geodetic of Canada Monument 'Fort Liard' Elev. = 216.299m

Survey was completed prior to drilling; therefore well as drilled may not necessarily agree with proposed location.

I, R.O. Blackall, of the City of Fort St. John, British Columbia, Canada Lands Surveyor, make oath and say that I have in my own proper person, according to law and the instructions of the Surveyor General of Canada Lands, faithfully and correctly executed the survey shown by this plan and field notes, and that the said plan and field notes are correct and true to the best of my knowledge and belief.
SO HELP ME GOD

R.O. Blackall, CLS

Sworn before me at Fort St. John, this 06th day of July, 1999.

THIS SURVEY WAS EXECUTED DURING THE PERIOD
JUNE 25th TO JUNE 27th, 1999. BY R.O. BLACKALL, CLS

APPENDIX I

Borehole Logs, Tables and Drawings from North Shore Preliminary Stage 2 Report

Borehole Log: 17C01

Client: Paramount Resources Ltd.

Project: Phase 2 Environmental Site Assessment

Legal Location: O-35

Area of Concern: Background Control

NORTH SHORE Environmental Consultants

SUBSURFACE PROFILE			SAMPLE					
Depth (mbgl)	Symbol	Description	Depth (m)	Sample #	Sample Type	Lab analysis	VOC Concentration (ppm) 50 100 150 200 250 300 350 / LEL (%) 10 20 30 40 50 60 70 80 90 / EC Value (dS/m) 1 2 3 4 5 6 7 8 9	Borehole Completion Details
0		Clay, brown (10YR 4/3), moderate, medium, massive, moist, firm, 2-5% fine gravel <8mm, disturbed, iron and sand inclusions	0.00 - 0.20	1	B	M		
			0.30 - 0.50	2	B	M		
			0.80 - 1.00	3	B	M, PS, SAL		
1		Hard clay, gray (10YR 5/1), strong, medium, massive, moist, very firm, 2-5% fine gravel <8mm, 2-5% coarse gravel 8-64mm, undisturbed	1.30 - 1.50	4	B			
			1.70 - 1.90	5	B			
2			2.20 - 2.50	6	B			
		Dup A @ 2.8-3.0m	2.80 - 3.00	7,8	B			
3			3.20 - 3.40	9	B	PS, SAL		Drill Cuttings
4			4.30 - 4.50	10	B			
			4.70 - 4.90	11	B	PS, SAL		
5			5.80 - 6.00	12	B			
6		End of Borehole at 6.00 m.
